

Showcase 2005: Public Sector Business Design

Sept 19th, 2005

Agenda

- 1:30 to 2:45
 - Business Design Overview
 - Program and Outcome Definition
- 2:45 – 3:00
 - Break
- 3:00 – 4:30
 - Program and Service Alignment
 - Horizontal Service Design
 - Process and Work Design

Presentation Objectives

- Broaden awareness of public sector business design and use of government standard reference models, such as the Government Strategic Reference Model (“GSRM”)
- Show how this approaches supports business transformation in better aligning government to citizen outcomes
- Teach you fundamentals of aligning services to outcomes using the GSRM concepts
- Leave you with at least one new ‘good idea’!

Business Design Overview

Introduction

- Public Sector Business Design: The alignment of government to citizen outcomes:
 - A public sector business design is a *formal government business blueprint* that is used to assess the business AS-IS or to specify the business TO-BE
 - A standard public sector reference model is a toolkit for improving the effectiveness of public sector business design
 - There are a number of government challenges and opportunities driving a need for more effective public sector design
- Premise:
 - Government can be better designed and aligned to citizen outcomes through the use of standard public sector reference models (MRM, PSRM, GSRM)

Public Sector Business Design Challenges and Opportunities

- Public sector organizations are under greater pressure to:
 - Do more with less I.e. expenditure review. Low hanging fruit is gone.
 - Serve higher public expectations and achieve client outcomes
- Business and technology change continues at an accelerated rate
- Key emerging opportunities:
 - Common service delivery
 - E-government
 - Cross-jurisdictional collaboration

Business Design Tasks

Architecture:
Standardizing the parts
and relationships

Design:
Arranging the parts

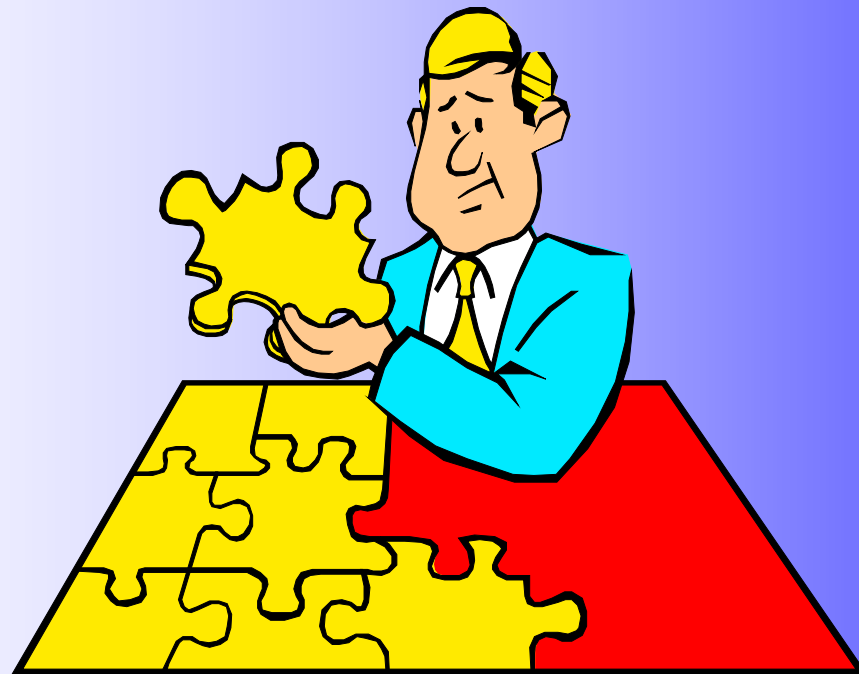

Governance:
Aligning the parts

**Without a business design
the big picture
doesn't hang together !**

It's too complex!!

Implementing Without a Holistic Design Yields Unpredicted results!

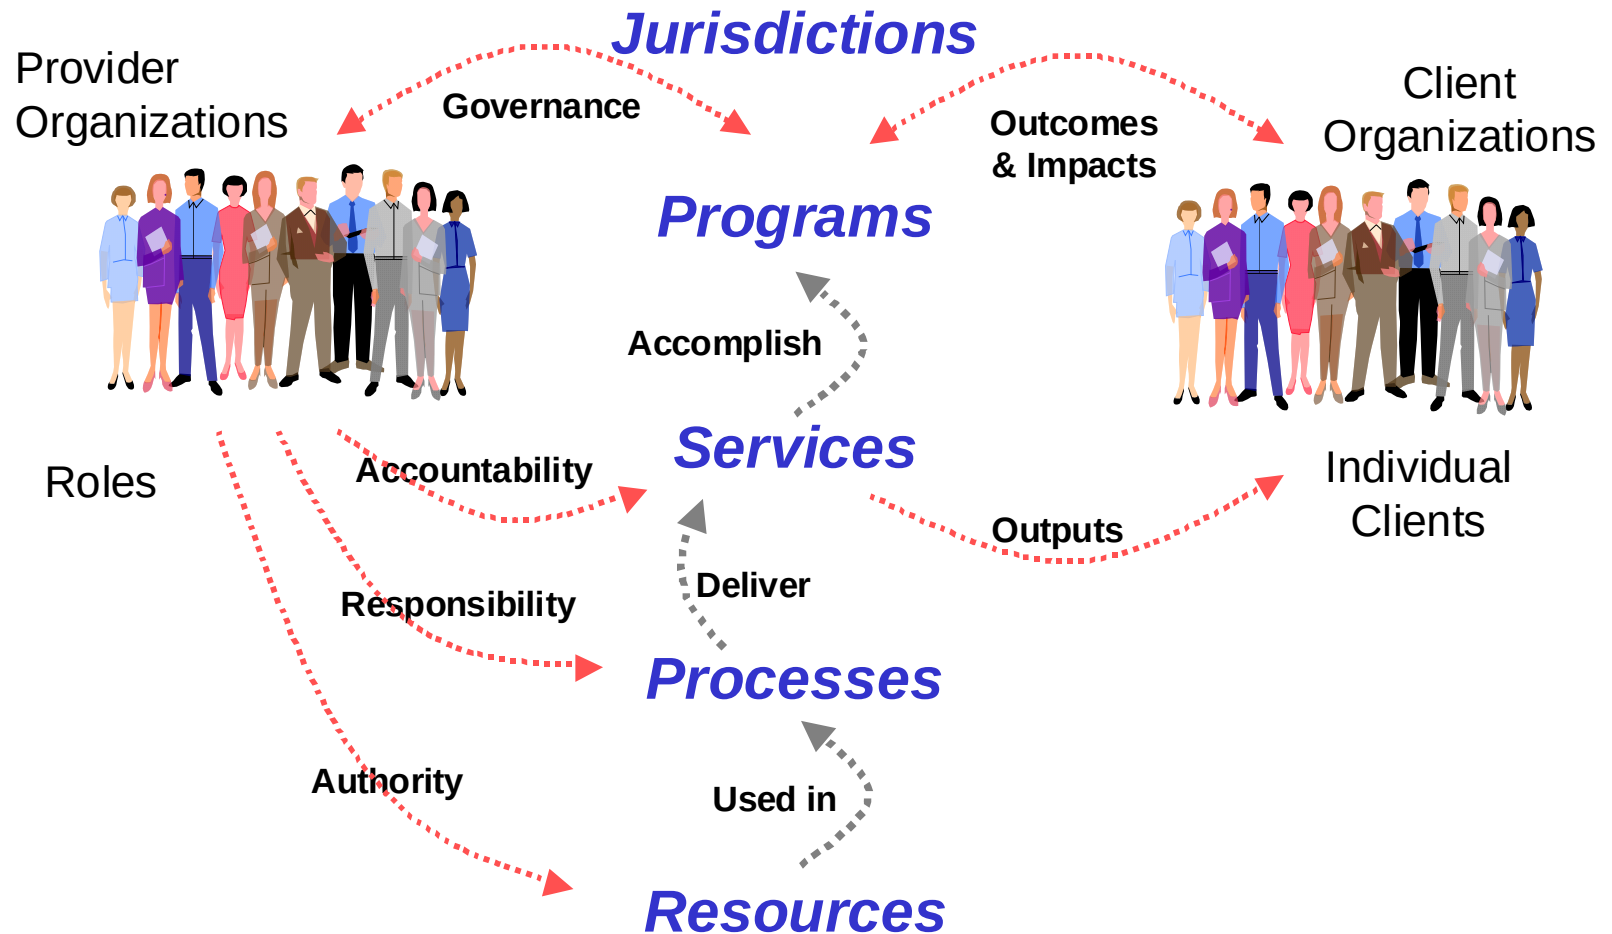

Public Sector Reference Models Introduce Revolution in Public Sector Business Design

- ‘Government Owned, Open Source Standard’ to describe the ‘business of government’ using common language:
 - Governments of Canada Strategic Reference Model (“GSRM”) – Federal Government
 - Public Service Reference Model (“PSRM”) – Ontario Provincial Government
 - Municipal Reference Model (“MRM”) – Municipalities
- Use of standard public sector reference model
 - Allows business designs to be scalable, integrated and aligned across traditional program and jurisdictional boundaries!
 - Provides common tools and common language in support of stakeholder communication, collaboration and consensus
- GSRM Includes:
 - Standard Set of Public Sector Business Components & Definitions
 - Standard Set of Integrated Business Models and Methods
 - Reusable Business Patterns

A Public Sector Reference Model is Needed

- Public enterprises are more complex than private (10x)
- Have a duty to address all “knowable” implications of their policies and actions
- Use profoundly different “business” paradigms
 - “guardian” values vs. “trader” values (Jane Jacobs)
 - reach and outcomes vs. market share and profit
 - programs vs. markets
- Collaborate and compete under different constraints compared to the private sector

Public Service Reference Model Components

Extended view of public sector reference model

Provider Programs & Services

Public Programs & Services

The Public

Zachman Framework and Architectures

Business Architecture

ENTERPRISE ARCHITECTURE - A FRAMEWORK™

	DATA What	FUNCTION How	NETWORK Where	PEOPLE Who	TIME When	MOTIVATION Why	
SCOPE (CONTEXTUAL)	List of Things Important to the Business 	List of Processes the Business Performs 	List of Locations in which the Business Operates 	List of Organizations Important to the Business 	List of Events Significant to the Business 	List of Business Goals/Strat 	SCOPE (CONTEXTUAL)
Planner	Entity = Class of Business Thing e.g. Semantic Model	Function = Class of Business Process e.g. Business Process Model	Node = Major Business Location e.g. Business Logistics System	People = Major Organizations e.g. Work Flow Model	Time = Major Business Event e.g. Master Schedule	Ends/Mean=Major Bus. Goal/ Critical Success Factor e.g. Business Plan	Planner

Classification of GSRM Models

“Government DNA”

Concept Context	Resources, Outputs	Programs, Services	Locations, Jurisdictions	Target-Groups, Providers	Events, Cycles	Needs, Outcomes
	Information Models	Program, Service & Process Models	Logistics Models	Community, Organization & Workflow Models	Client State Models	Performance & Program Logic Models
Logic	Implementation Methods & Models, e.g.: Unified Process (UP) UN Modeling Method (UMM)					

Program, Service and Process Models - the “Through Line” of Alignment

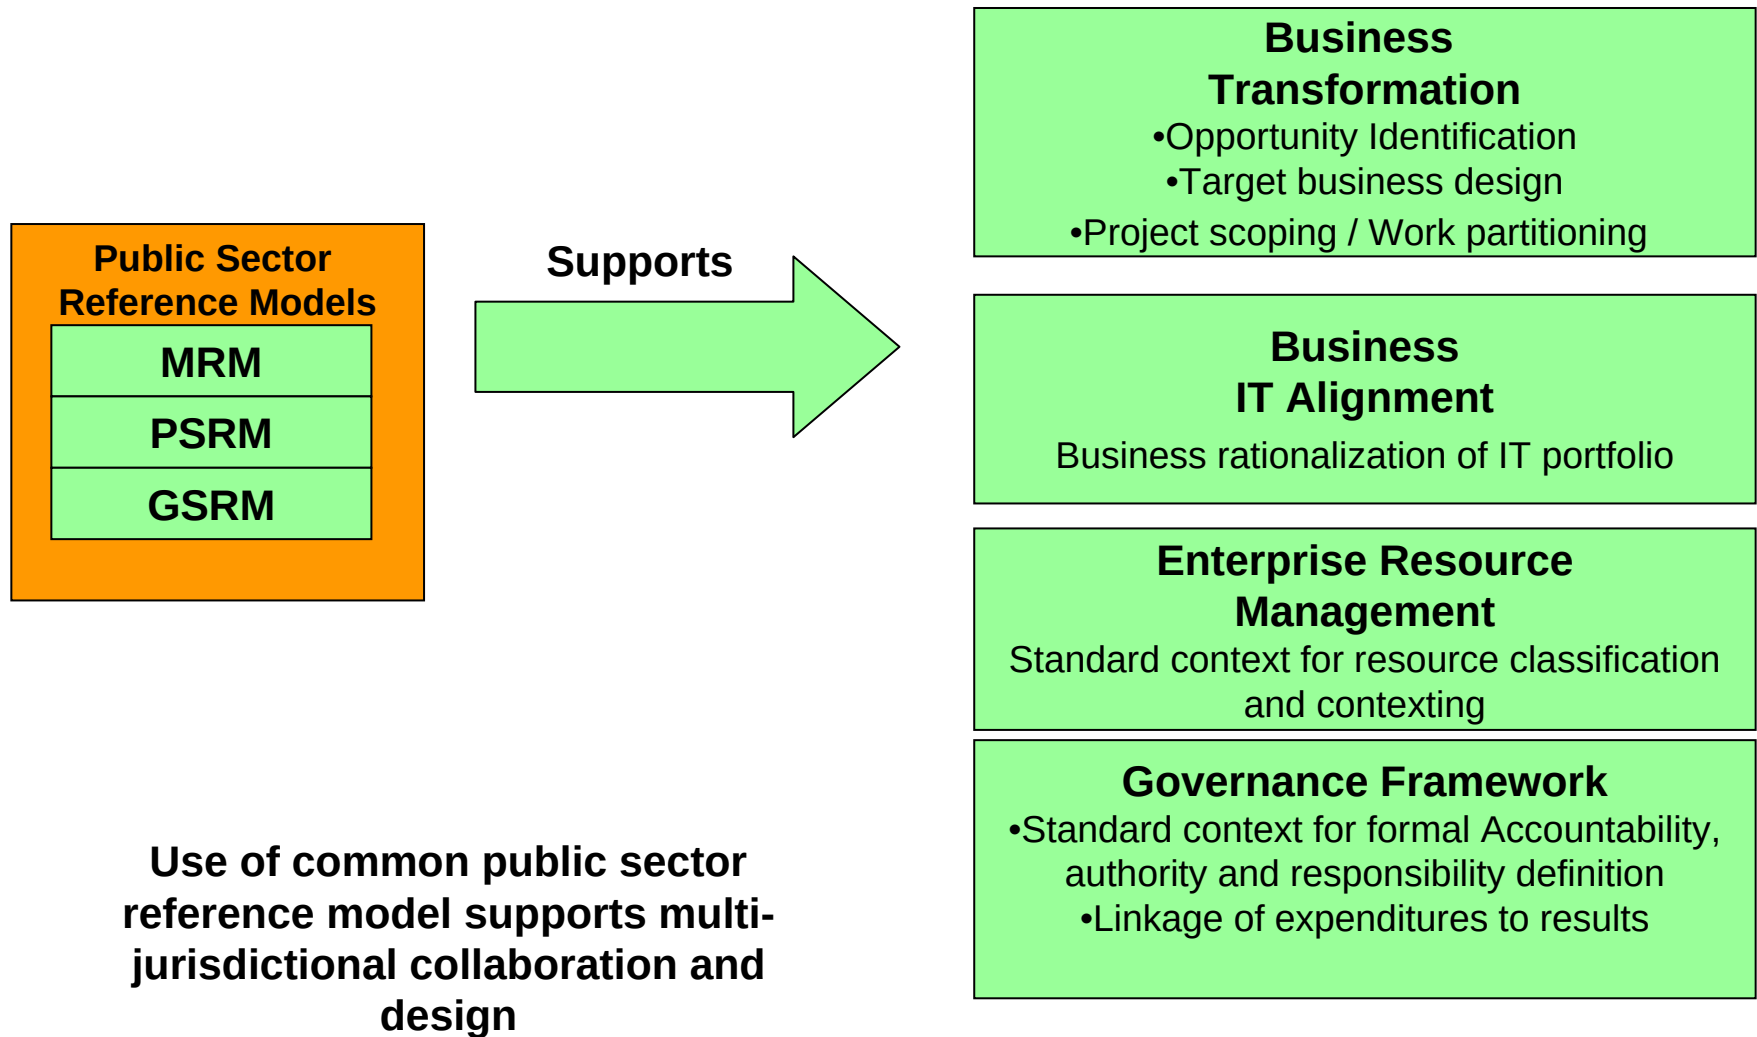

Business design comes down to evaluating and answering key fundamental business questions

1. What are the programs ultimate outcomes?
2. What services need to be delivered to achieve program outcomes?
3. What horizontal accountabilities are required to support delivery?
4. What KPIs are needed to evaluate performance and guide investments?
5. What work / processes are required to support service delivery? What resources are needed? What are roles and responsibilities?
6. How do I effectively align and optimize business and IT initiatives?

Business Design Benefits

- Mitigation of complex change initiative risk
- Better use and deployment of resources, lower TCO – business and IT resources
- Better opportunity identification – alignment / integration
 - Common service definition
 - Collaboration opportunities
 - IT portfolio consolidation
- Stronger change mgt
 - Integrated business and IT change mgt
 - Maintain bus alignment through change
- Crisper Communication
 - Supports formal stakeholder consensus

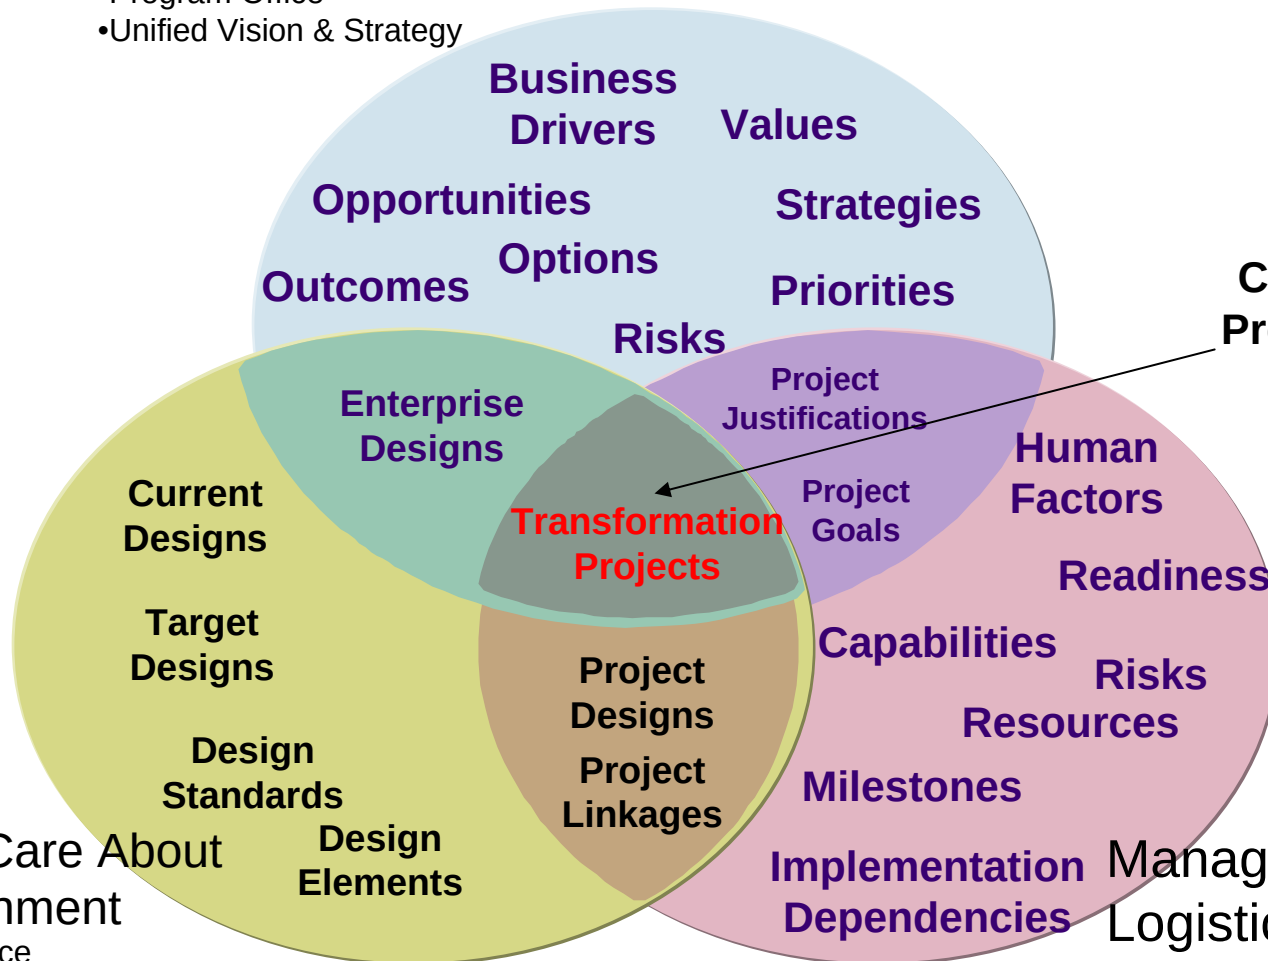

Public Sector Reference Model Applications

3 Dimensions of Transformation Governance

Planners Care About Strategic Alignment

- Program Office
- Unified Vision & Strategy

Everyone
Cares About
Project Status

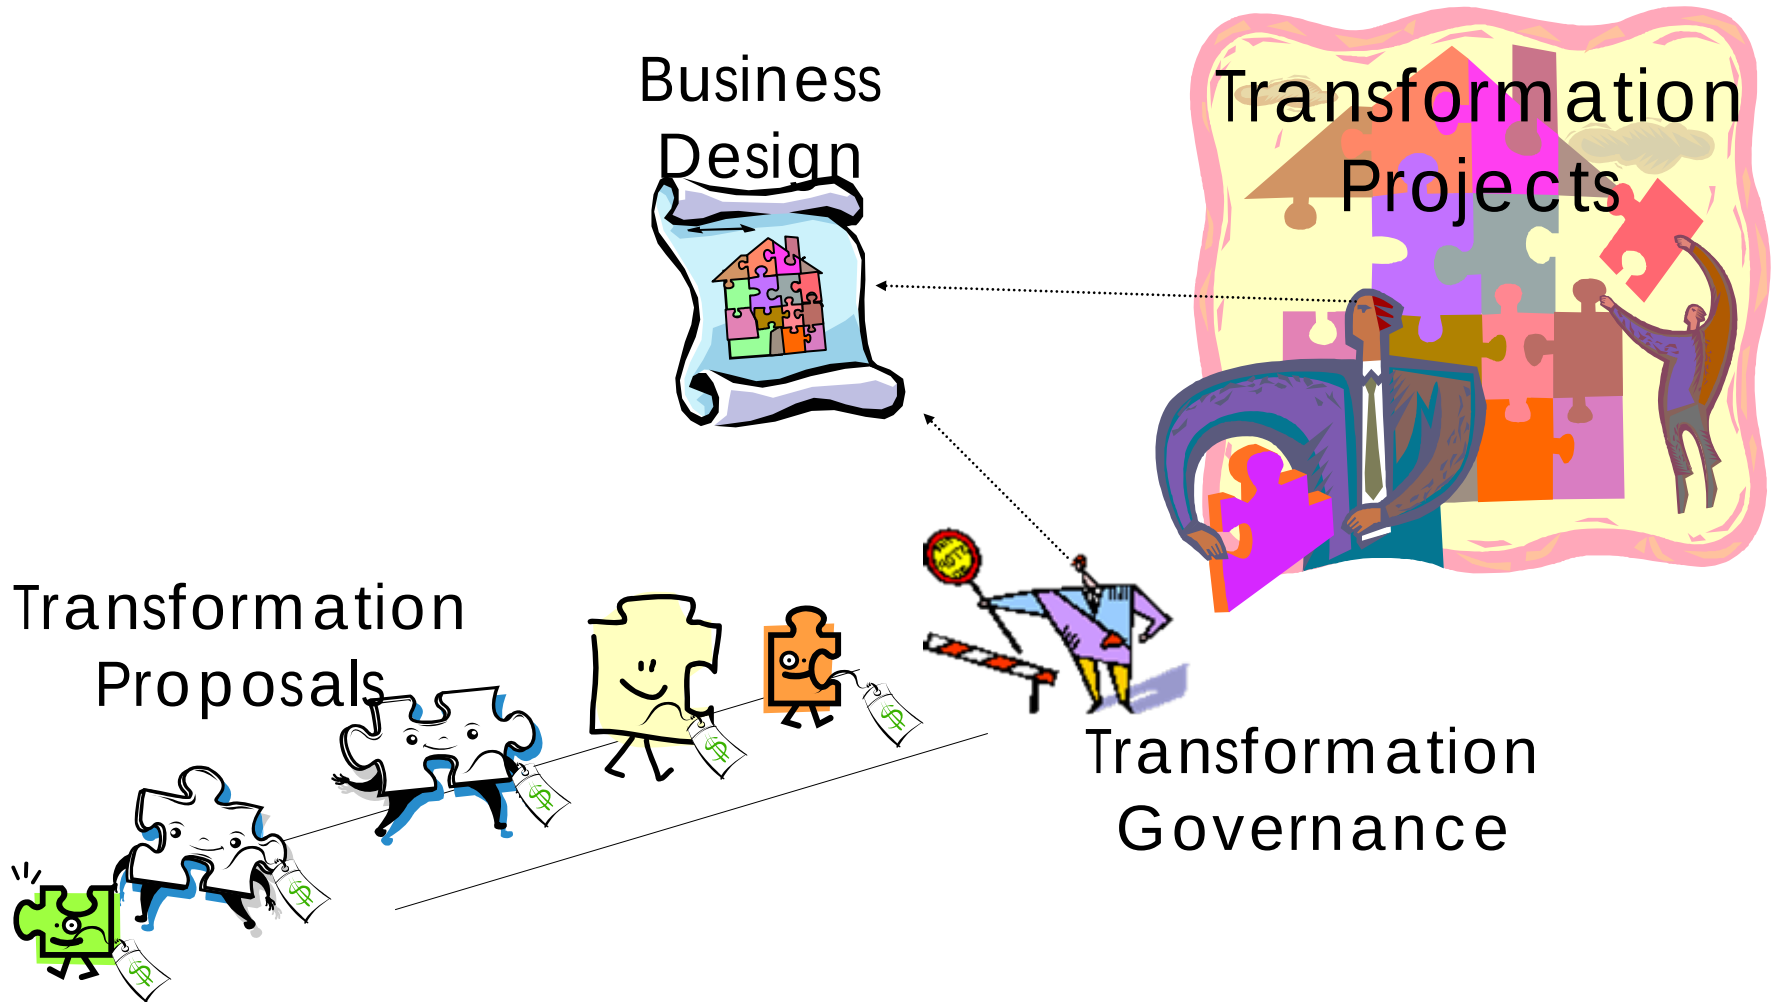

Architects' Care About
Design Alignment

- Architecture Office
- Unified Designs

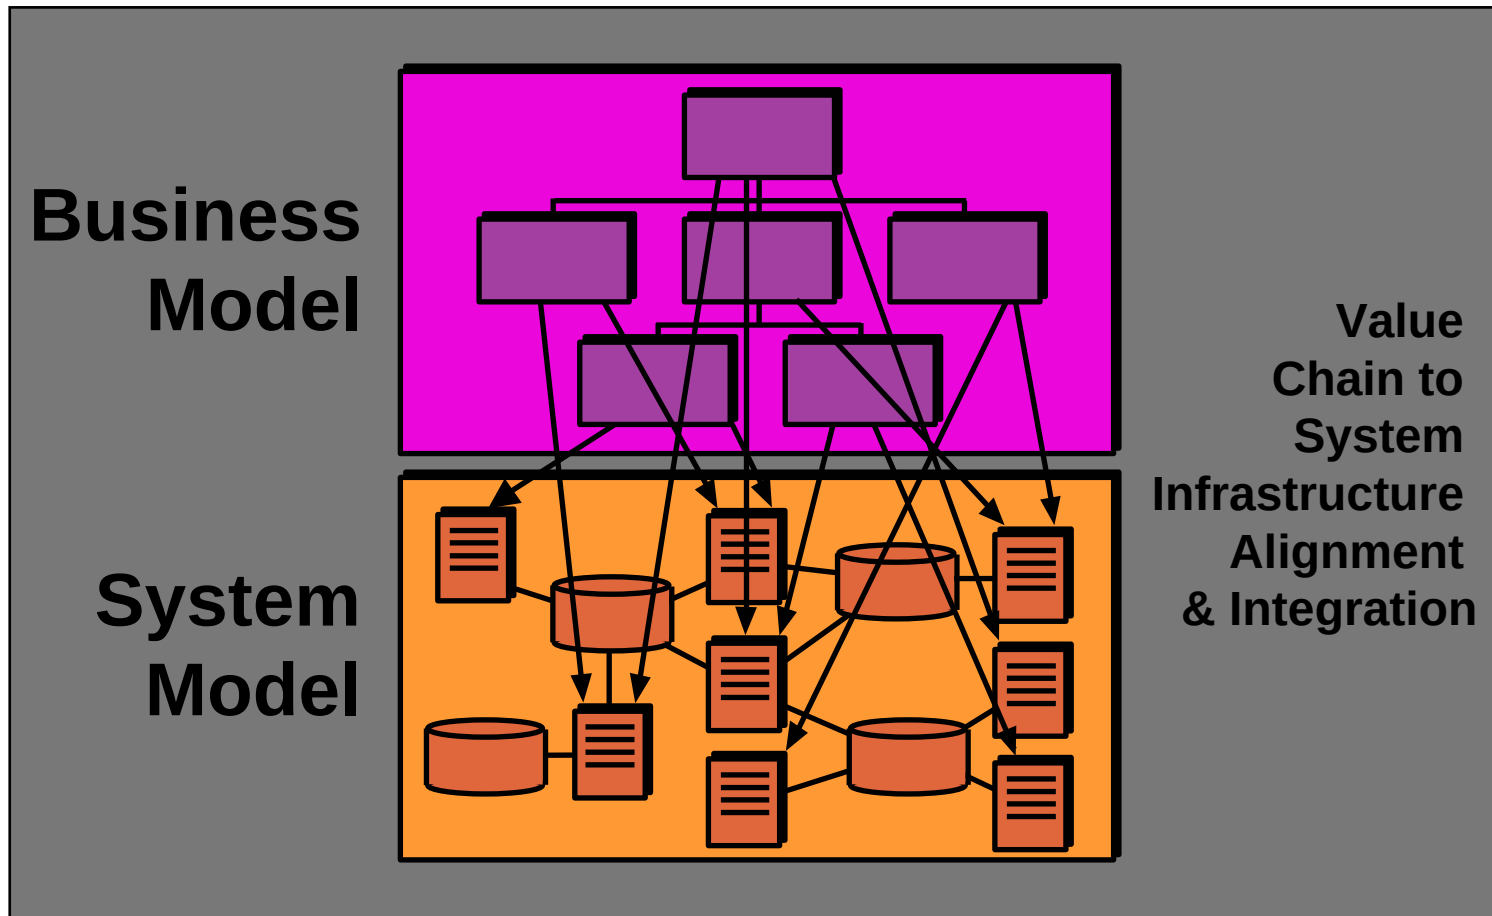

Managers Care About
Logistical Alignment

- Project Office
- Unified Plans

Business Design: a vision of the target enterprise – explicit & detailed

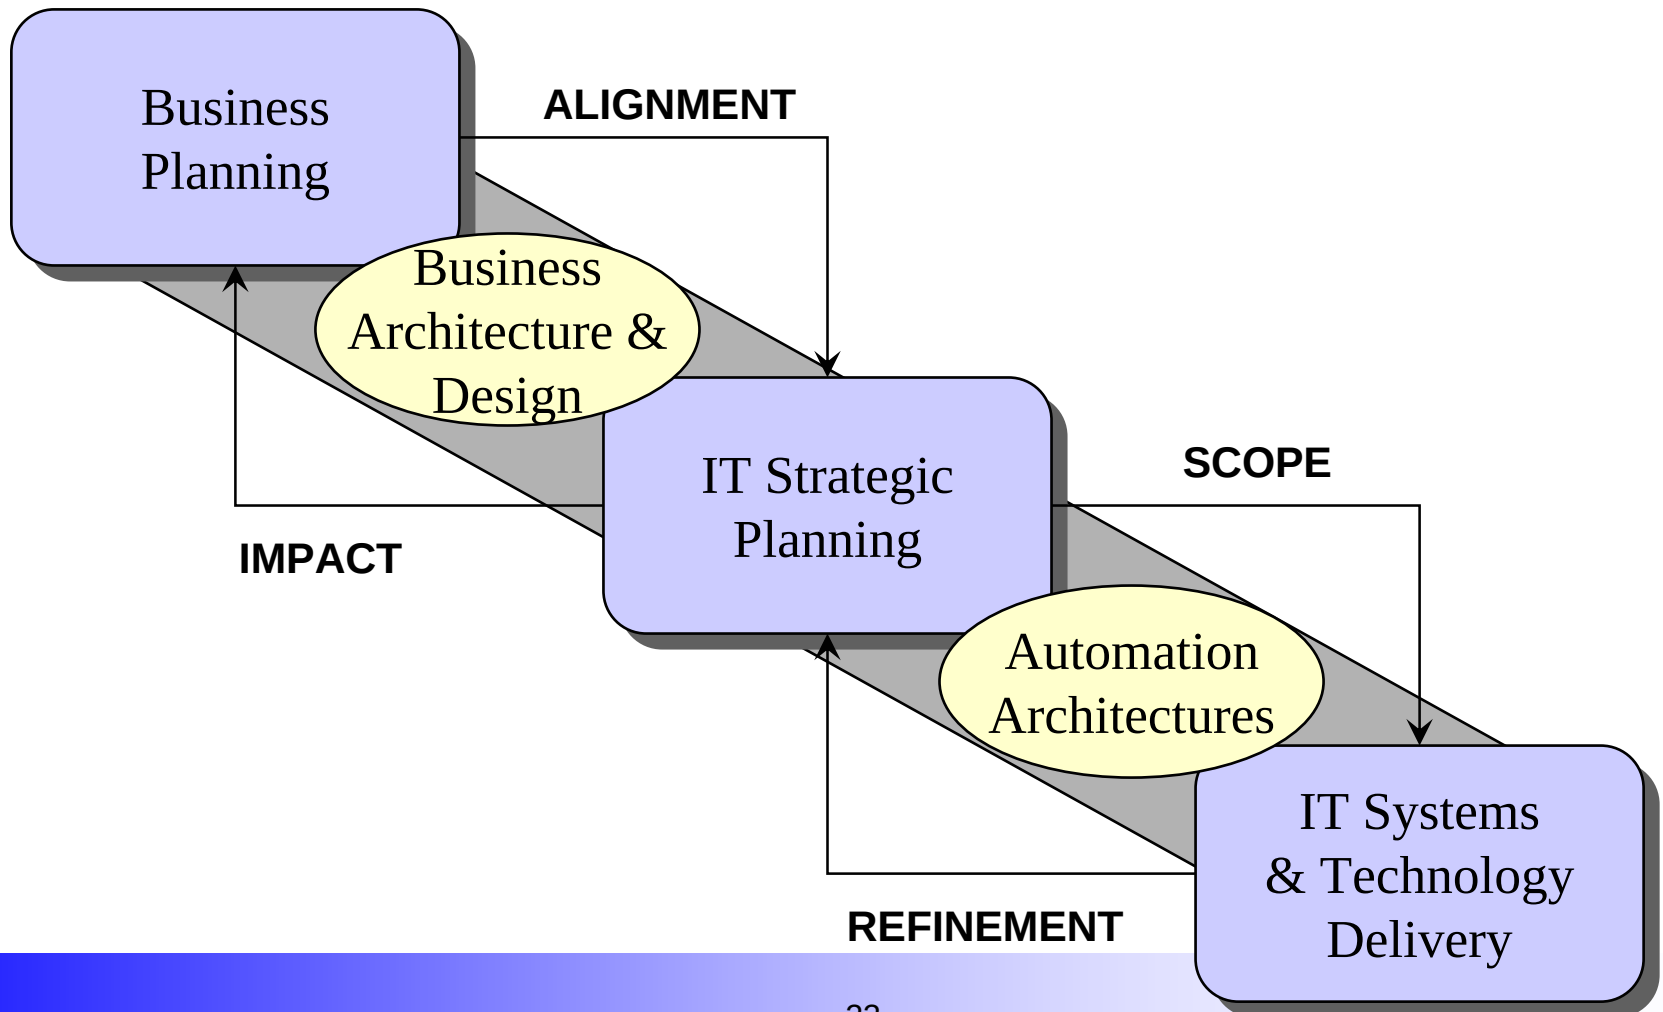

Business transformation dilemma

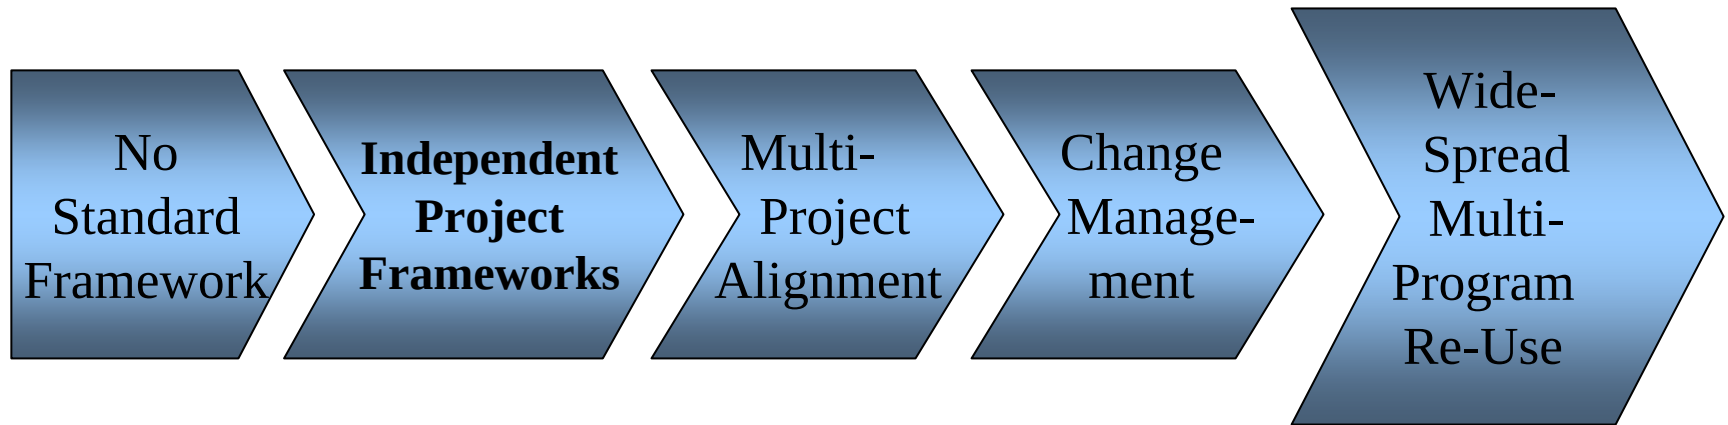

IF no alignment of IT and business Combined system
is highly resistant to change

IT Planning and Delivery in Context

Enterprise Architecture – (CMM) Capability Maturity Model

- Business architecture and I&IT architecture capability maturity may evolve at different rates
- Methodology maturity is also evolving

Reference Models

EWTA

Zachman

Why is a Formal Business Design Needed?

Start with the end in mind!

- ❑ Gain unambiguous *stakeholder consensus* on all aspects
- ❑ Reduce risk with stronger *evidence based decisions on strategy and implementation*
- ❑ Support the *ongoing alignment and governance of changes*
- ❑ Show *interdependencies and linkages* within and between departments, agencies across jurisdictions
- ❑ Provides a rigorous foundation for *business and IT alignment*
- ❑ Improves overall business analysis and planning capability

What's Different about Reference Model Based Approach?

- Legacy focus

- Industry focuses more on TO-BE technology rather than on the TO-BE business design
- Uses a variety of 'silo business models" - symptoms include current inability to link expenditures and results
- Focuses on narrow view of business e.g. process work view and is limited in formally expressing strategic context
- If used at all, services and programs are described informally or with multiple conflicting interpretations
- Provides many "pictures" as opposed to "testable models"

How Does a Reference Model Improve Business Change Planning?

Business Patching

- ❑ Legacy transformation practices are analogous to a software patch
- ❑ A patch makes a change to fix a symptom and acknowledges a 'lack of understanding' of the underlining system
- ❑ Business patching is risky, adds complexity

Business Design

- ❑ Acknowledges that the whole system needs to be understood and expressed as a design before implementing and changing (this is universal in other architectural realms)

Public Sector Reference Model Key Trends

- Development of Pan-Canadian standard
- Through line between business design and systems design
- Use of reference models as foundation to knowledge and information
- Greater integration of reference models, business design and traditional business analysis and planning
- Increased harvesting and re-use of business designs across jurisdictions
- Shift away from IT to business as key 'buyers'
- Increased formality of business design governance
- Increased government investment in capability and capacity development

Why Should Government Care?

- Precedent in many jurisdictions is to evolve to a common reference model approach:
 - US Federated Enterprise Architecture Framework (FEAF)
 - OPS Enterprise Architecture Program Method (EAPM)
- Movement is towards inter-jurisdictional design
- Requires new skills and competencies / ramp-up time
- Can target a large variety of business problems and needs i.e. there's something in it for everyone
- Horizontal reviews: Low-hanging fruit is gone in terms of cost savings without major transformation
- Need a strategy to address constantly increasing level of complexity and rate of change!

Public sector business design challenges

- The discipline of formal language e.g. services, programs, clients
 - Client may already have a 'set of services' defined
- Challenges of describing business in a technology neutral way
- Perception that business design “Slows things down” and adds to cost
- Procurement is not equipped for business design competencies
- Perception that business design is technical and owned by IT
- Standards for business design are still emerging
- Business design tends to be iterative and ongoing – it's a more a process than a thing

Case Study # 1: Federal IM Program Design (GSRM)

- GSRM is being used to define the “business of IM” in the federal government
 - Iteration 1: Defined IM programs, services, outcomes and outputs
 - Identified gaps and overlaps between respective roles of central agencies (NLAC, PWGSC, TBS)
 - Identified target organizational strategies
 - Workshops with agency stakeholders are being conducted to resolve gaps / overlaps and decide on target accountabilities, roles and organizational structure

Case Study # 2: CCAC And Long Term Care, Ontario Ministry of Health (PSRM)

- PSRM was used to define overall business context for Community Care Access Centres and Long Term Care Facility
 - Define a target service delivery model
 - Define integrated view of performance – linking service outputs to program outcomes
 - Define operational workflows and process roles and responsibilities
 - Uses to assess impact and structure common assessment implementation

Case Study # 3: Halifax Amalgamation Business Planning / Business Design (MRM)

- Halifax Regional Municipality was created on April 1, 1996 through the amalgamation of five predecessor municipalities.
- MRM used as management tool to support amalgamation planning
- Program and service definition and harmonization
- Complexity of this amalgamation initiative needs to be appreciated
 - integrating 13 fire departments, four police departments

“I credit the MRM with enabling us to accomplish in 10 months what other local governments have taken 3-5 years to achieve.” Dan Gautreau-Principle, Corporate Initiatives,- Halifax Regional Municipality

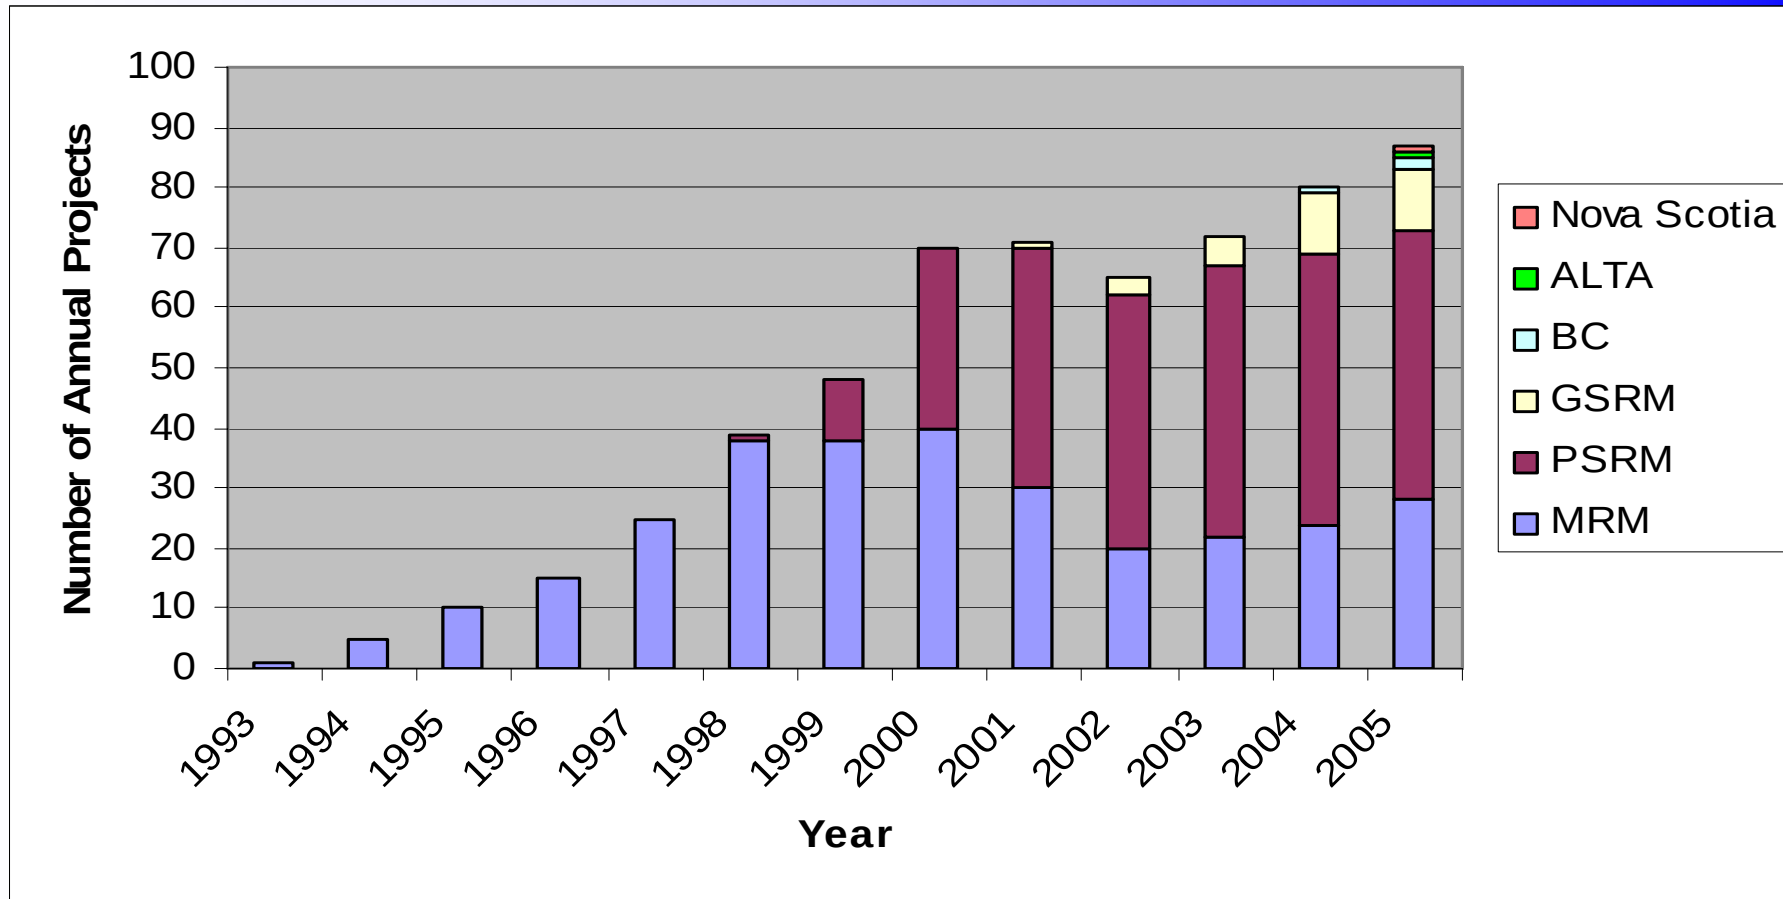

Case Study #4 - Senior Services Mapping Initiative (GSRM)

- Veterans Affairs Canada engaged representatives from multiple government jurisdictions to conduct Senior's Service Mapping and Identify Key Opportunities
- The BTEP methodology and GSRM framework were used to:
 - Set a foundation for describing seniors program and service across jurisdictions
 - Define a senior's problem statement
 - Catalogued and analyzed over 200 services and programs
 - Identify three transformation opportunities to improve the delivery of services to seniors

Case Study #5 Ministry of Consumer and Business Services, Provincial Government of Ontario (PSRM)

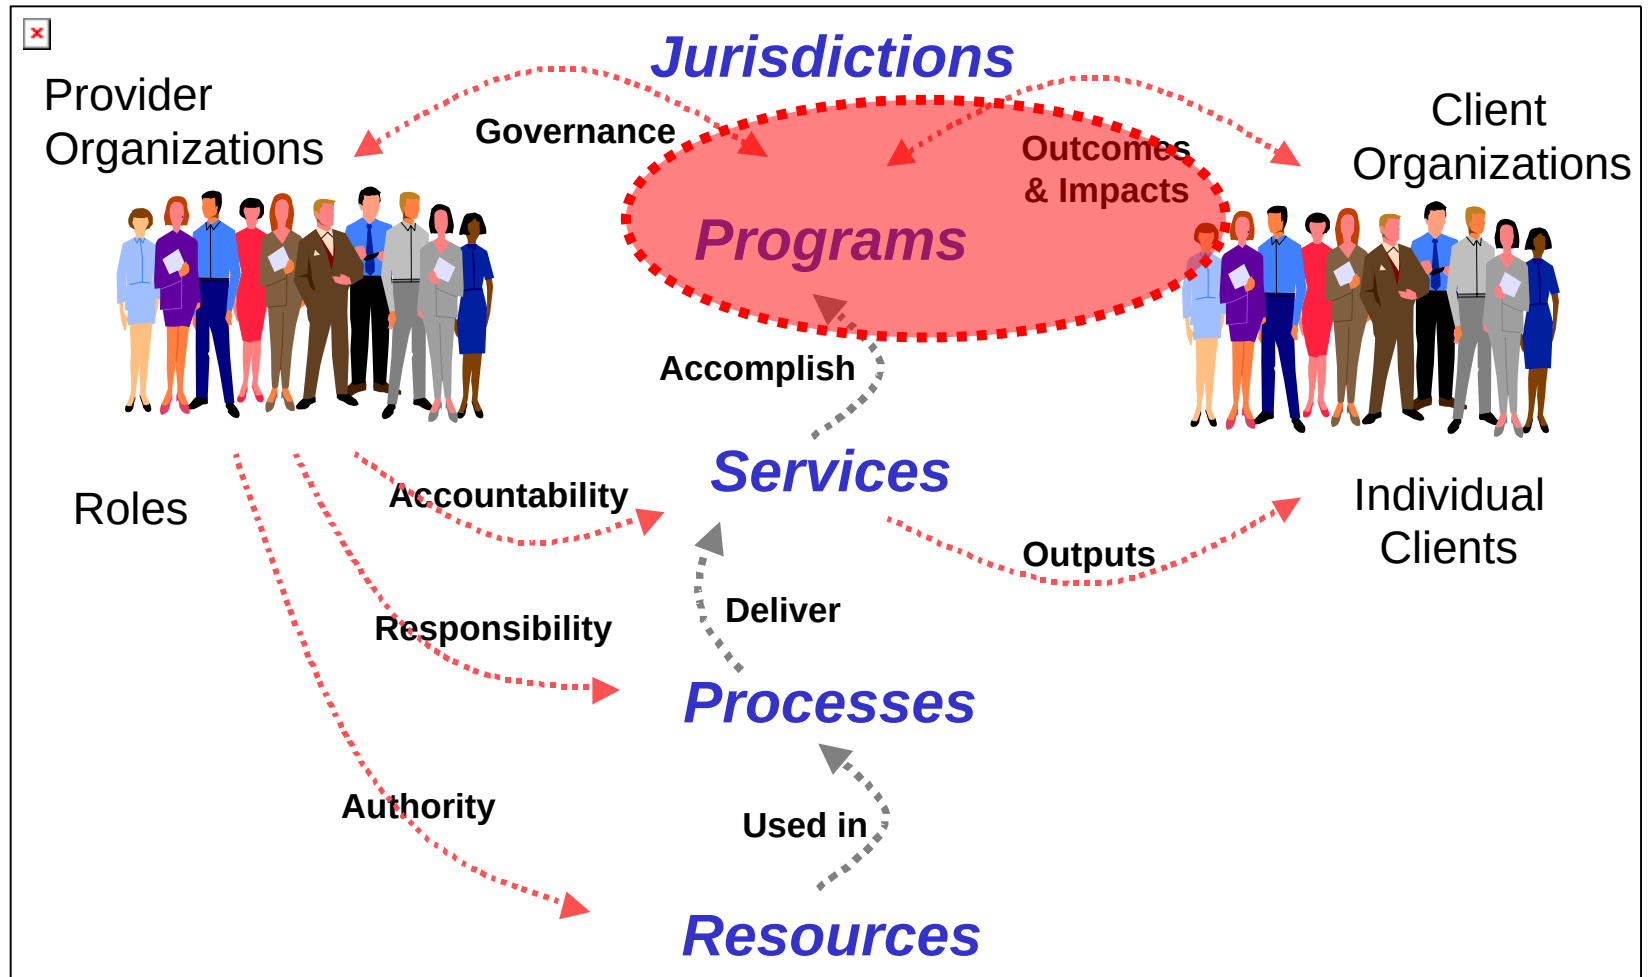

- PSRM was used to define Integrated Service Delivery (ISD) business model
 - Defined ISD program outcomes, services and KPIs
 - Defined horizontal service accountability relationships between service providers on ISD 'value chain'
 - Defined ISD operational business scenarios
 - Identified common business and IT components

Estimated # of Projects Using Public Sector Reference Model

PROGRAM AND OUTCOME DEFINITION

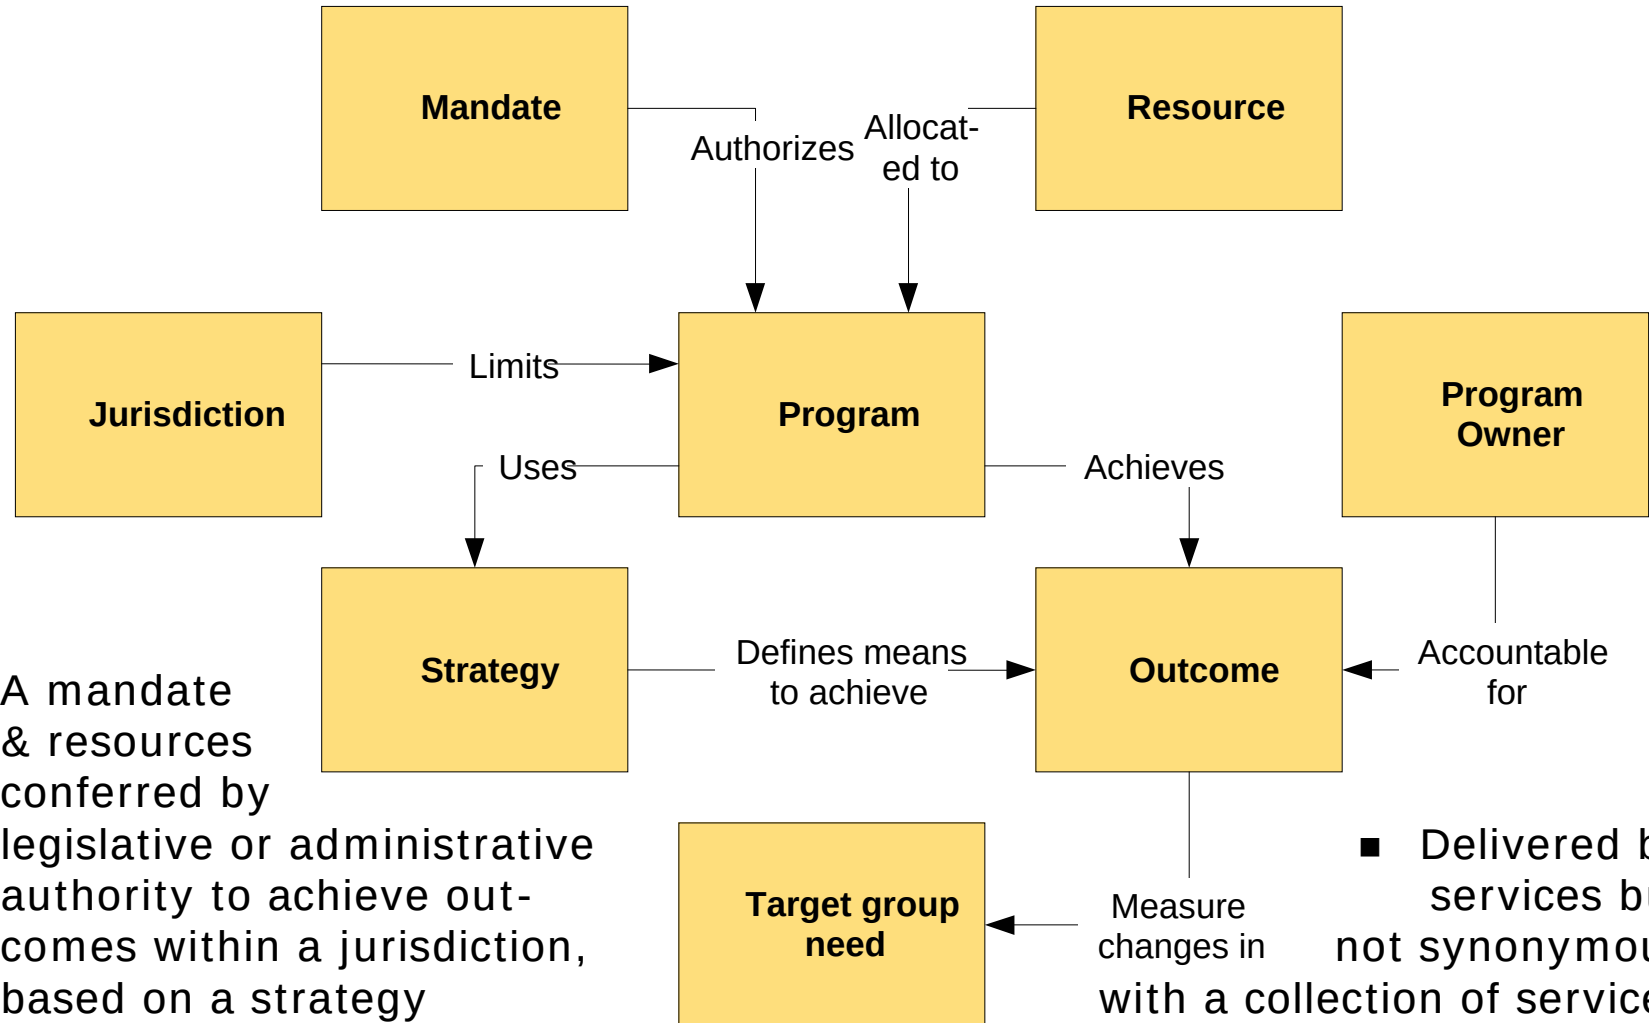

Program and Outcomes in Context

Program and Services

- The terms “program” and “service” have been used informally or inconsistently in government
 - Program refers to change initiative, operational business unit, funding bucket etc.
- Formal treatment of these concepts is required to:
 - Gain stakeholder consensus and agreement
 - Support common measurement and business requirements
 - Foster re-use and sharing of materials – ‘what’s the same’, as opposed to ‘what’s different’
 - “Knit together” a consistent holistic view of government

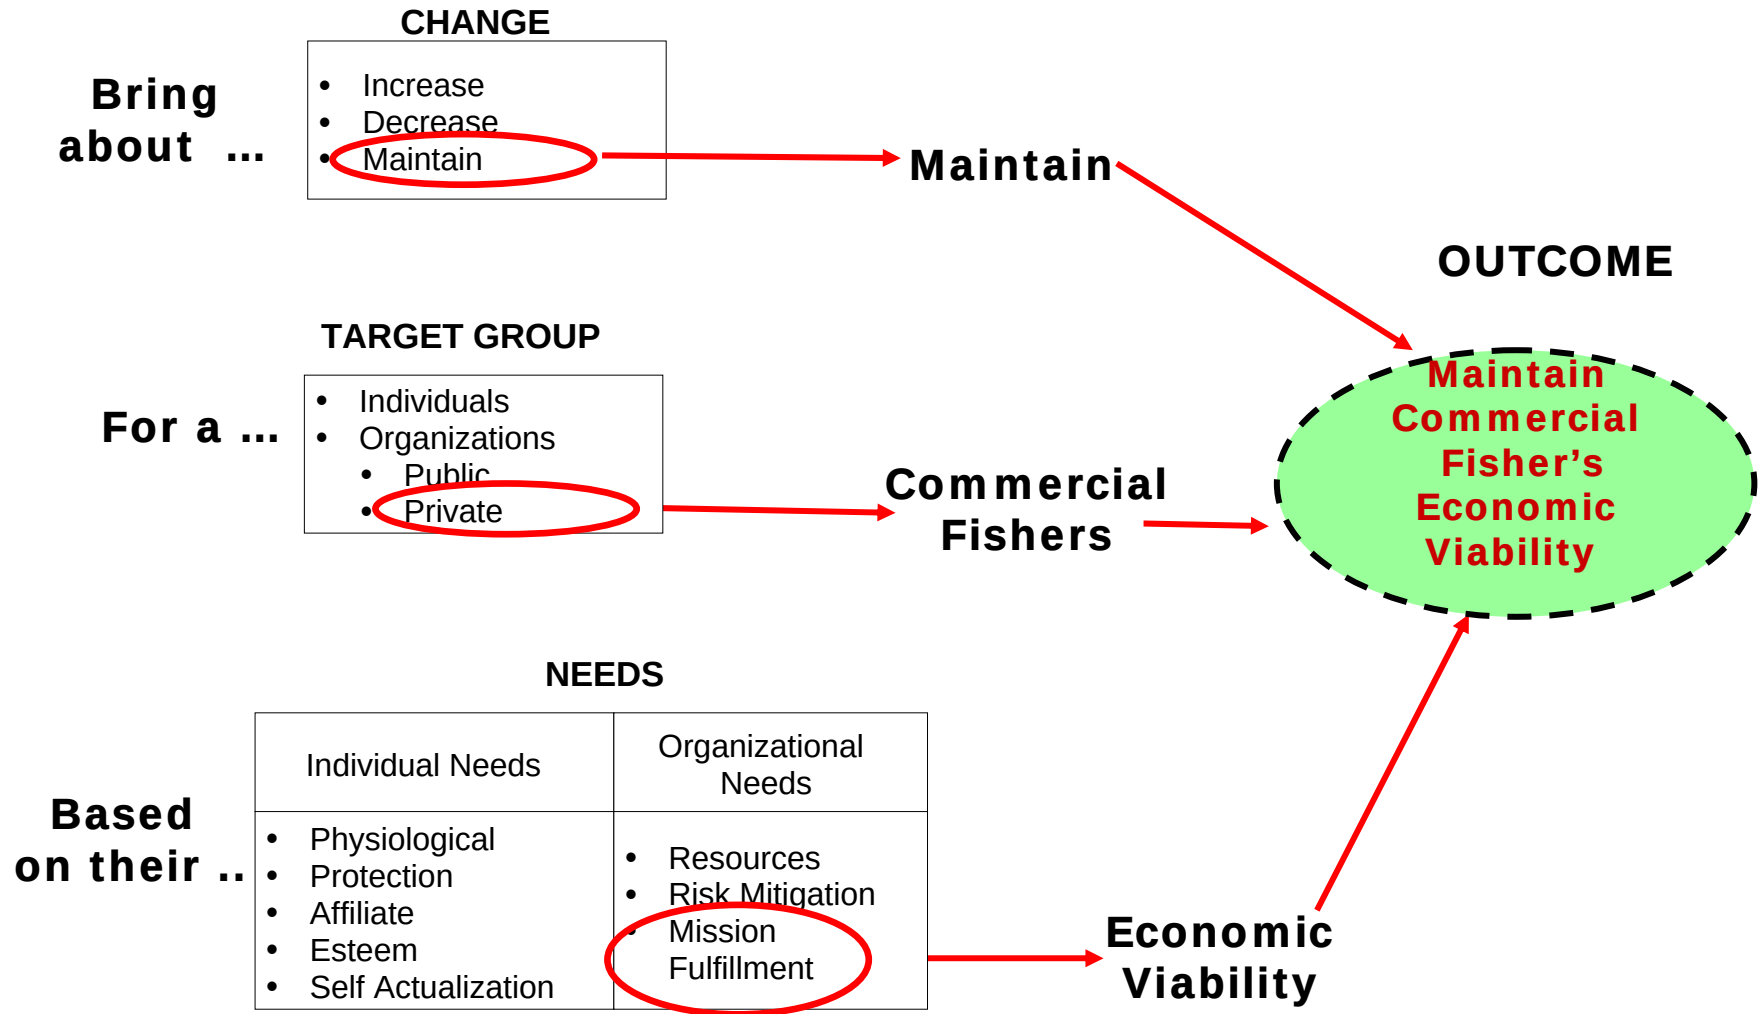

Program

Program Outcome Definition

- A program outcome definition is the nucleus of 'program definition' - 'highest point of alignment'
- GSRM standard ensures statement of program outcome is "well-formed" - traceable back to client needs
- Standardizing and formalizing program outcome definition supports:
 - Consistent program evaluation (PAA)
 - Identification of opportunities across program boundaries, within and across jurisdictions
 - Basis for effective integration and analysis of performance information
 - Required for all alignment of business design

A program outcome combines target group, need and desired change!

Formal program outcome statements can be related logically

- Current Strategic Outcome for Health Research Institutes:
“Outstanding, ethical and responsive Canadian health research”

Target group	Recognized need	Desired Trend
<i>Canadian health researchers</i>	<i>International recognition</i>	<i>Increase</i>
<i>Canadian health researchers</i>	<i>Compliance with ethical standards</i>	<i>Increase</i>
<i>Canadian public</i>	<i>Health research responsiveness</i>	<i>Increase</i>

- Current SO for HRDC: “The opportunity to fully participate in the workplace and community”

Target group	Recognized need	Desired Trend
<i>Working population</i>	<i>Opportunity to work</i>	<i>Increase</i>
<i>Working population</i>	<i>Meaningful work</i>	<i>Increase</i>

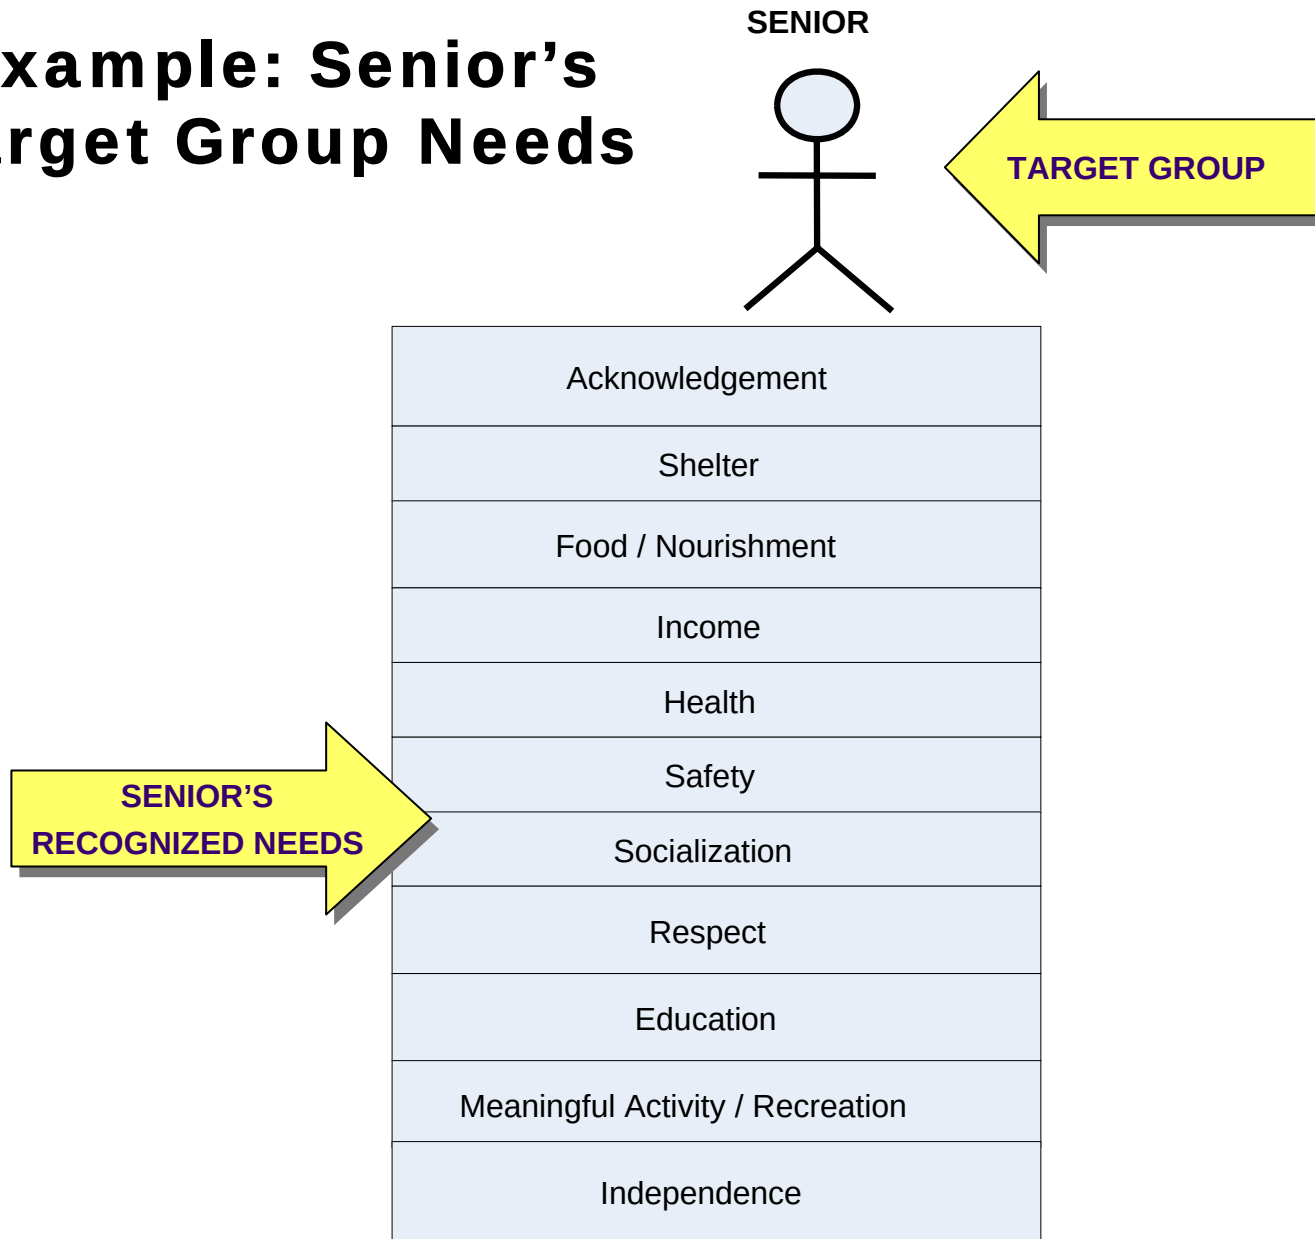

Target Groups

- A population comprised of individuals or organizations with designated characteristics or properties that determine eligibility for services
 - Intrinsic properties – examples:
 - age, gender, etc. of public individuals;
 - business structure (e.g. partnership, corporation, non-profit, etc.) of public organizations;
 - Extrinsic properties - examples:
 - citizenship, location, health condition, etc. of public individuals;
 - business condition (e.g. profitable, bankrupt, etc.) of public organizations;
- Target group needs to be countable, and rule for inclusion needs to be explicit!
 - I.e. Does Canadian public include visitors? Canadians living abroad? Citizens? Etc.

Recognized Needs

- A need is an innate requirement of an individual person or organization
- A recognized need is a need or an expression of a need that the government acknowledges a duty to address (has a mandate)
- Needs are distinct from requirements. Requirements relate to the response to the need, not need itself.
- Individual Need Types (Maslow's hierarchy)
 - Physiological
 - Security
 - Belonging
 - Esteem
 - Self-Actualization
- Organizational Need Types
 - Mission Fulfillment
 - Risk Mitigation
 - Resources

Example: Senior's Target Group Needs

GSRM Program Fields

Program (or Policy) Field: A broad area of need that groups or classifies programs; actions within a program field can be harmonized; actions between program fields can be in conflict.

Public Program Fields

- Administers services that address recognized needs of public target groups:
 - Natural Resources
 - Justice
 - Public Health
 - etc.

Provider Program Fields

- Administers services that address recognized needs of provider target groups:
 - Human Resources
 - I.T.
 - Finance
 - Supply Chain
 - etc.

GSRM Public Program Fields – A standard way to classify government outcomes based on needs

Public Program Fields	Recognized Public Needs
(Socio-)Economic Development	Need to organize, work, trade and prosper Need for protection from economic crimes
Science and Knowledge Development	Need for new knowledge
Natural Resources	Need to use/consume natural resources Need to sustain/renew natural resources
Environmental Protection	Need to enjoy and rely on the natural environment
Public Health	Need for protection from illness and disease
Legal, Collective, Democratic & Human Rights Protection	Need for recognition and protection of legal, collective, human, and democratic rights and freedoms
Social Development	Need to overcome disadvantages Need to help others and share prosperity and community
Cultural Development	Need for preservation of identity, history, tradition, values
Educational Development	Need to develop human capabilities
Public Safety	Need for protection from natural and built hazards Need for protection from violent crime
Justice	Need for fair and just treatment Need to sanction (punish) law-breakers
National Security & Defence	Need for protection from insurrection, terrorism, international threats and defence of freedom

© Government of Canada, 2004

GSRM Provider Program Fields - continued

Provider Program Fields	Recognized Provider Needs
Public Policy, Planning and Management Services	Need to address public needs and accomplish public goals
Corporate Policy, Planning & Management Services	Need to shape the enterprise to accomplish public goals
Integrated Delivery Services	Need to integrate service delivery from different program fields
Communications Management Services	Need to communicate with the public and with providers including the government
Human Resources Management Services	Need to deploy and steward the government's human resources
Financial Management Services	Need to deploy and steward the government's financial resources
Information Management & Technology Services	Need to deploy and steward the government's information
Supply Chain Management Services	Need to ensure supply and conserve the government's resource expenditures
Administrative Services	Need to deploy and use the government's resources, facilities and assets
Facilities and Assets Management Services	Need to maintain & steward facilities & assets entrusted to the care of government
Professional Services	Need to comply with laws, regulations and best practices as an enterprise

© Government of Canada, 2004

Program Strategy

- Defines the broad parameters and constraints for achieving program outcomes
- There are only a limited number of strategies:
 - Direct regulation, e.g. requires licensing and inspection services
 - Indirect regulation, e.g. legislate and monitor a professional body such as the College of Physicians and Surgeons
 - Direct support, e.g. veteran's hospital care
 - Indirect support, e.g. business grants
 - Direct protection, e.g. patrolling and SWAT Team services
 - etc.
- Strategies apply to both public and provider programs
 - E.g. corporate service to monitor computers (protection service) and intervene in the case of a virus outbreak

Target Group
“Hierarchy”

Needs “Hierarchy”

Policy/Strategy
Patterns

Individuals

Safety

Prevention

Women

Freedom from
Violence

Treatment

Counseling

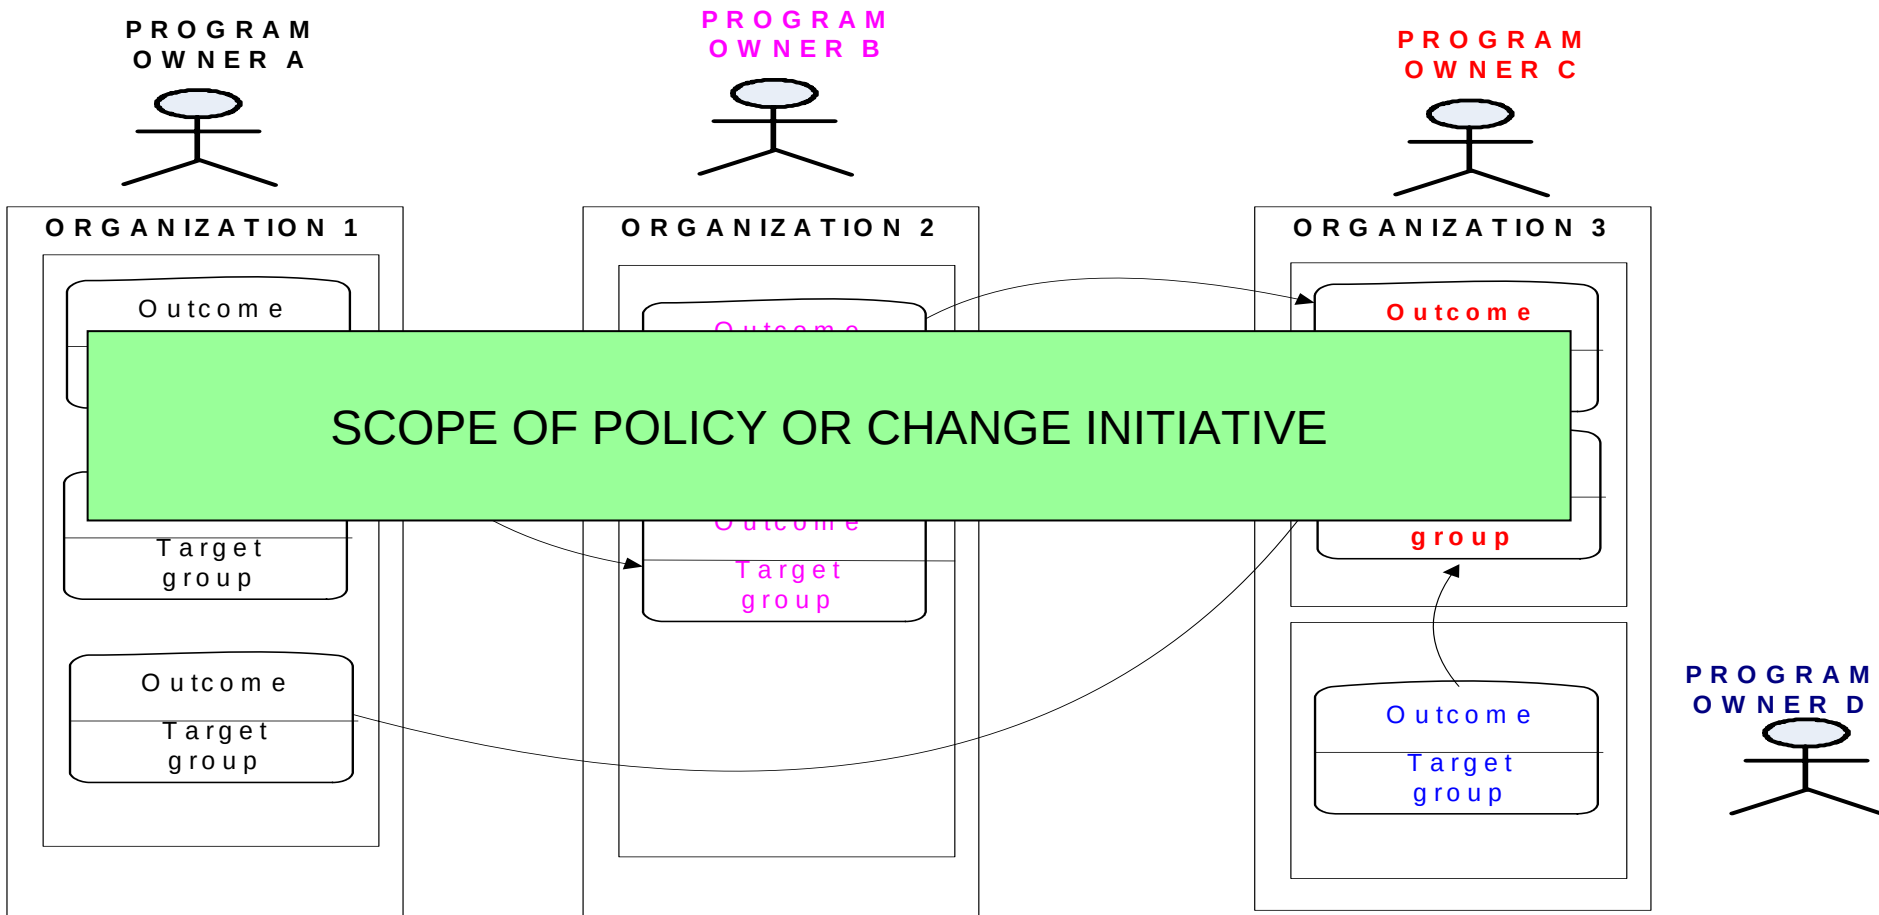

Vocational skills training

Aligning government programs starts with aligning authoritative definitions of target group and need hierarchies

Outcome Network Model Example

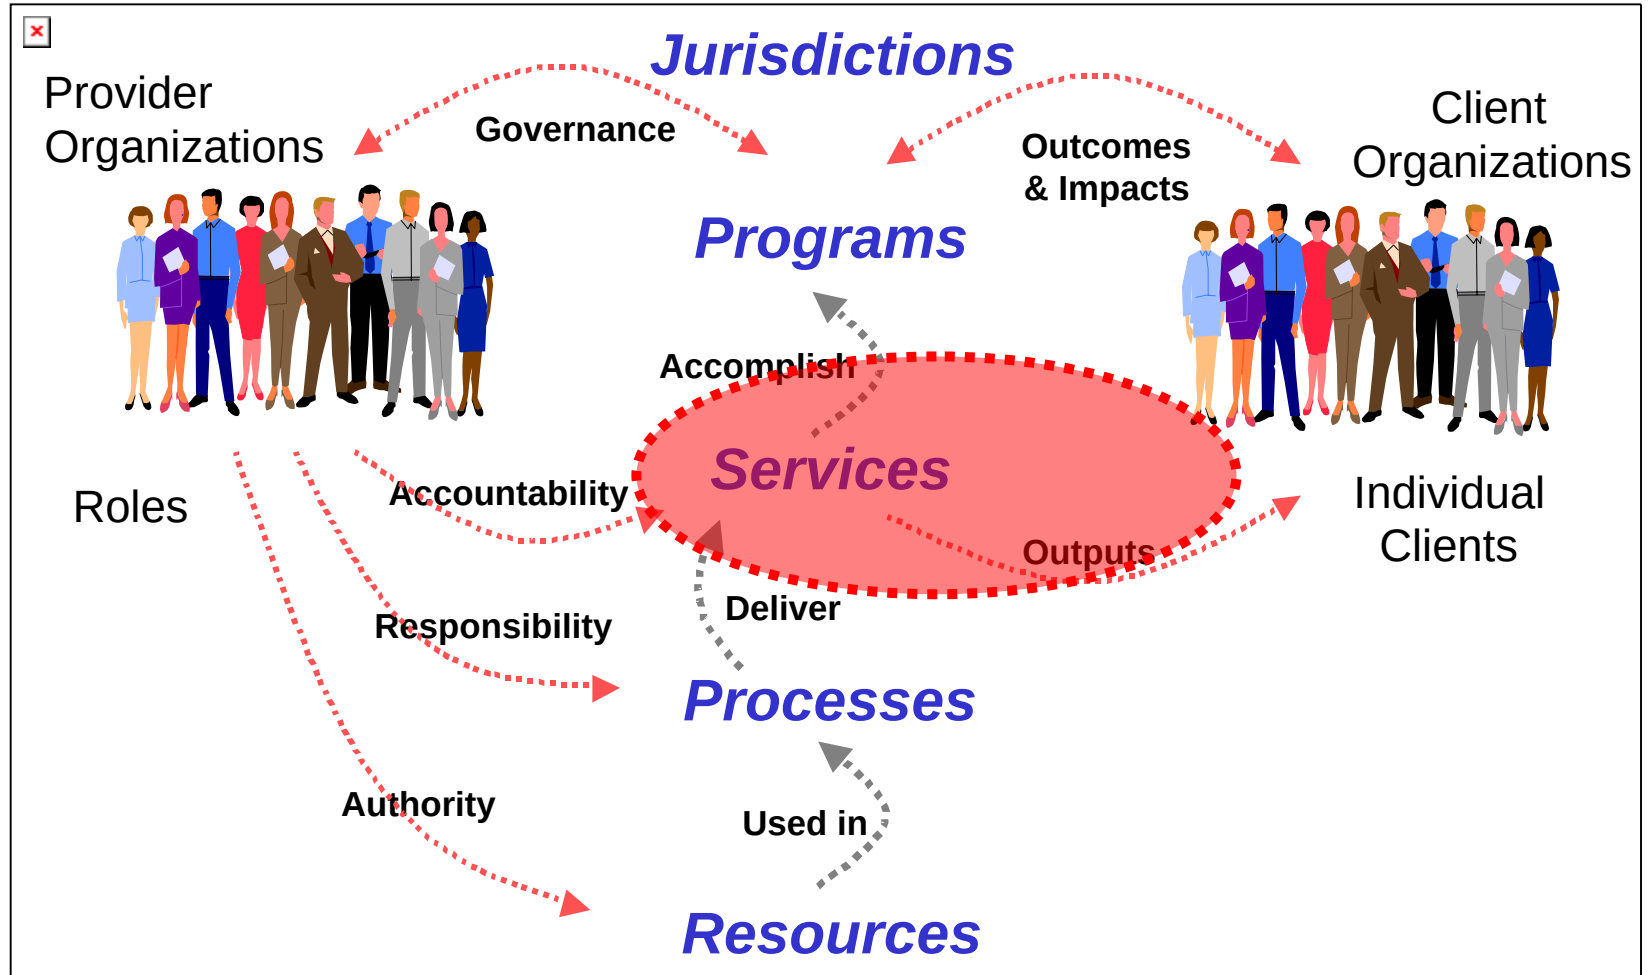

Program Outcome Analysis

How does shared view of outcomes and linkages influence Opportunity identification? Collaboration? MOA/MOUs? Organizational Design?

SERVICE DEFINITION

Services in Context

Service Definition

- A service is a means to create desirable change in target group needs of one or more programs by managing delivery of valuable outputs or resources in response to requests of authorized clients (GSRM definition)
- Programs define the outcomes! Service outputs achieve the outcomes!
- Services deliver measurable discrete units of value to clients to meet recognized needs
- A program service “portfolio” is aligned over time to ensure alignment to program outcomes and best use of resources

Service Modeling Rules

- **Repetitive:** the proposed service must produce the same output, and only that output, repeatedly.
- **Two or more independent recipients:** the proposed service must have two or more potential recipients who are independent of each other in terms of their motivation and ability to take up the service's output.
- **Independence from other services:** the proposed service must be independent of other services, meaning that if another service is withdrawn for some reason, the service in question continues to exist and remains unchanged in terms of its output type.

Services

- From a client's perspective, services are independent
 - e.g. “fixing a pothole” is not a service to the end-client. ‘providing road access’ is!
- Service definition is a key bridge between work/policy design and work design
- Services are not a work functional concept, but a value concept! Supports ‘results-based management

19 GSRM Service Types - A standard way to classify government government services

1. Provide funds
2. Provide resources
3. Provide transport
4. Provide advisory encounters
5. Provide matches, referrals and linkages
6. Provide new knowledge
7. Provide promotional encounters
8. Provide recreational and cultural encounters
9. Provide educational and training encounters
10. Provide care and rehabilitation encounters
11. Provide periods of agreement
12. Provide periods of permission
13. Provide periods of protection
14. Provide findings
15. Provide interventions
16. Provide rulings & judgments
17. Provide penalties and periods of sanction
18. Provide rules
19. Provide implemented changes

Each service pattern contains a set of standard processes and performance metrics

1. Provide Funds

- **Definition:** *Services that acquire or dispense money*
- **Essence of Accountability:** Appropriate Use
- **Essence of Service Delivery:** Dispensing / Collecting
- **Examples:**
 - Grants and contributions (how many are Grants & Contributions applications are there?)
 - Budget transfer

2. Provide Resources

- **Definition:** *Services that acquire or dispense units of resources or periods of a use of a resource*
 - Includes Labour, energy, land, facilities, movable assets, supplies
 - Excludes funds, information and rules
- **Essence of Accountability:** Appropriate Use
- **Essence of Service Delivery:** Conveying

Examples:

- Swimming pool access
- Wheelchair access
- Facility management

3. Provide Transport

Definition: *Services that move people and resources from point to point*

- **Essence of Accountability:** Delivery
- **Essence of Service Delivery:** Transporting

Examples:

- Public transit
- Postal service
- Secure Channel

4. Provide Advisory Encounter

- **Definition:** *Services that provide an encounter during which data, information and/or advice is conveyed to a party or a system*
- **Essence of Accountability:** Appropriate Use / Faithful interpretation
- **Essence of Service Delivery:** Advising

Examples:

- Consultation
- Electronic information provision
- Signage, billboards

5. Provide Matches, Referrals and Linkages

Definition: *Services that match, refer or link one party to another*

- **Essence of Accountability:** Obligation to both parties
- **Essence of Service Delivery:** Brokering

Examples:

- Health care triage
- Library holdings referral

6. Provide New Knowledge

- **Definition:** *Services that conduct research.*
- **Essence of Accountability:** Innovation
- **Essence of Service Delivery:** Discovering

Examples:

- Cancer research services
- IM metadata standards research

7. Provide Advocacy and Promotional Encounters

- **Definition:** *Services that represent, advocate for or promote government programs and services by speaking to, persuading, or creating awareness in people*
- **Essence of Accountability:** Persuasion
- **Essence of Service Delivery:** Advocating

Examples:

- 'Stop smoking' campaign
- Participaction awareness campaign

8. Provide recreational & cultural encounters

Definition: *Services that provide recreational and cultural experiences to people*

- **Essence of Accountability:** Values expressed
- **Essence of Service Delivery:** Presenting

Examples:

- State wedding
- Museum holding access

9. Provide educational & training encounters

- **Definition:** *Services that provide educational and training experiences to people*
- **Essence of Accountability:** Learning
- **Essence of Service Delivery:** Teaching

Examples:

- Apprenticeship training
-

10. Provide Care & Rehabilitation Encounters

- **Definition:** *Services that provide care and rehabilitation to people.*
- **Essence of Accountability:** Restoration
- **Essence of Service Delivery:** Restoring

Examples:

- Hospital care services
- Heritage building restoration

11. Provide Periods of Agreement

- **Definition:** *Services that resolve disputes or create agreements between parties*
- **Essence of Accountability:** Commitment of all parties
- **Essence of Service Delivery:** Negotiating

Examples:

- Union negotiator
- Common metadata standards agreement

12. Provide Periods of Permission

- **Definition:** *Services that express government authority by granting permission for a period of time to engage in activities, possess or control property or resources, or hold status, authority or privileges.*
- **Essence of Accountability:** Ensuring entitlement
- **Essence of Service Delivery:** Granting

Examples:

- Driver or vehicle licensing
- Vital statistics

13. Provide Period of Protection

- **Definition:** *Services that guard people and resources from threats. (includes land, facilities, movable assets, supplies, funds, information, but excludes labour, energy, rules)*
- **Essence of Accountability:** Vigilance
- **Essence of Service Delivery:** Guarding

Examples:

- Public defence
- Electronic information protection

14. Provide Findings

- **Definition:** *Services that inspect, investigate and analyze to uncover information and prepare findings and recommendations*
- **Essence of Accountability:** Diligence
- **Essence of Service Delivery:** Investigating

Examples:

- Property assessment
- Business audit
- Stock assessment

15. Provide Interventions

- **Definition:** *Services that intervene, respond to threats and emergencies, give aid, and restore order.*
- **Essence of Accountability:** Readiness
- **Essence of Service Delivery:** Intervening

Examples:

- Traffic Intervention
- Emergency Dispatch

16. Provide Rulings & Judgements

- **Definition:** *Services that apply rules and dispense justice.*
- **Essence of Accountability:** Fairness
- **Essence of Service Delivery:** Judging

Examples:

- Judicial ruling
- Communication priority ruling

17. Provide Penalties and Period of Sanction

- **Definition:** *Services that sanction, force compliance, mete out punishment and apply penalties*
- **Essence of Accountability:** Ensuring compliance
- **Essence of Service Delivery:** Enforcing

Examples:

- Parking Ticket
- Deportation

18. Provide Rules

- **Definition:** *Services that produce laws, regulations, policies, strategies, plans and designs.*
- **Essence of Accountability:** Reflecting mandate
- **Essence of Service Delivery:** Formulating
- **Examples:**
 - Legislative acts, policies
 - Business and IT plans, strategies, designs

19. Provide Implemented Changes

- **Definition:** *Services that bring about changes to existing programs and services including organization structure, practices and systems.*
- **Essence of Accountability:** Mitigating Risk
- **Essence of Service Delivery:** Implementing

Examples:

- Business or IT transformation
- System upgrade implementation

Service Efficiency Indicator Examples (GSRM)

Efficiency indicator Type	Examples Description
Average unit cost.	Value (sometimes price) of one service output compared with the Unit cost of the resources to produce and deliver it. This indicator is equivalent to Unit cost per service recipient. Many variations on this indicator are possible.
Average per-capita cost.	Total cost of producing all service outputs per time period, compared with the total number of service recipients targeted in that time period, whether served or not. This indicator is equivalent to the investment in meeting target group needs, and many variations are possible.

Service Quality Indicator Examples (GSRM)

Quality indicator Type	Description
Responsiveness	Refers to the responsiveness of the service to a request where applicable in relation to a rule.
Accuracy	Refers to the correctness of the output in relation to a rule where applicable, e.g. is the information or advice provided by the service correct?
Availability	Refers to the availability of the service according to a scheduling rule.
Compliance	Refers to the number of failures or departures from a constraint imposed for legal or policy reason, or due to an approved standard.
Reliability	Compares the reliability of the service's production and delivery of an output to a rule, e.g. error rate.
Capacity	Measures the capacity of the service to respond to fluctuations in demand and contingencies without compromising other metrics in terms of a rule.

Service Effectiveness Indicator Examples

Effectiveness indicator Type	Description
Outcome achievement	Refers to the degree to which the direct outcomes of the program(s), which the service contributes to, are achieved. A direct outcome is defined as a desirable trend in the level of a recognized target group need.
Takeup Rate	Refers to the rate at which service demand rises (or falls as appropriate) in a reference time period and is a proxy indicator for meeting a predicted level of need.

Integrated View of Performance

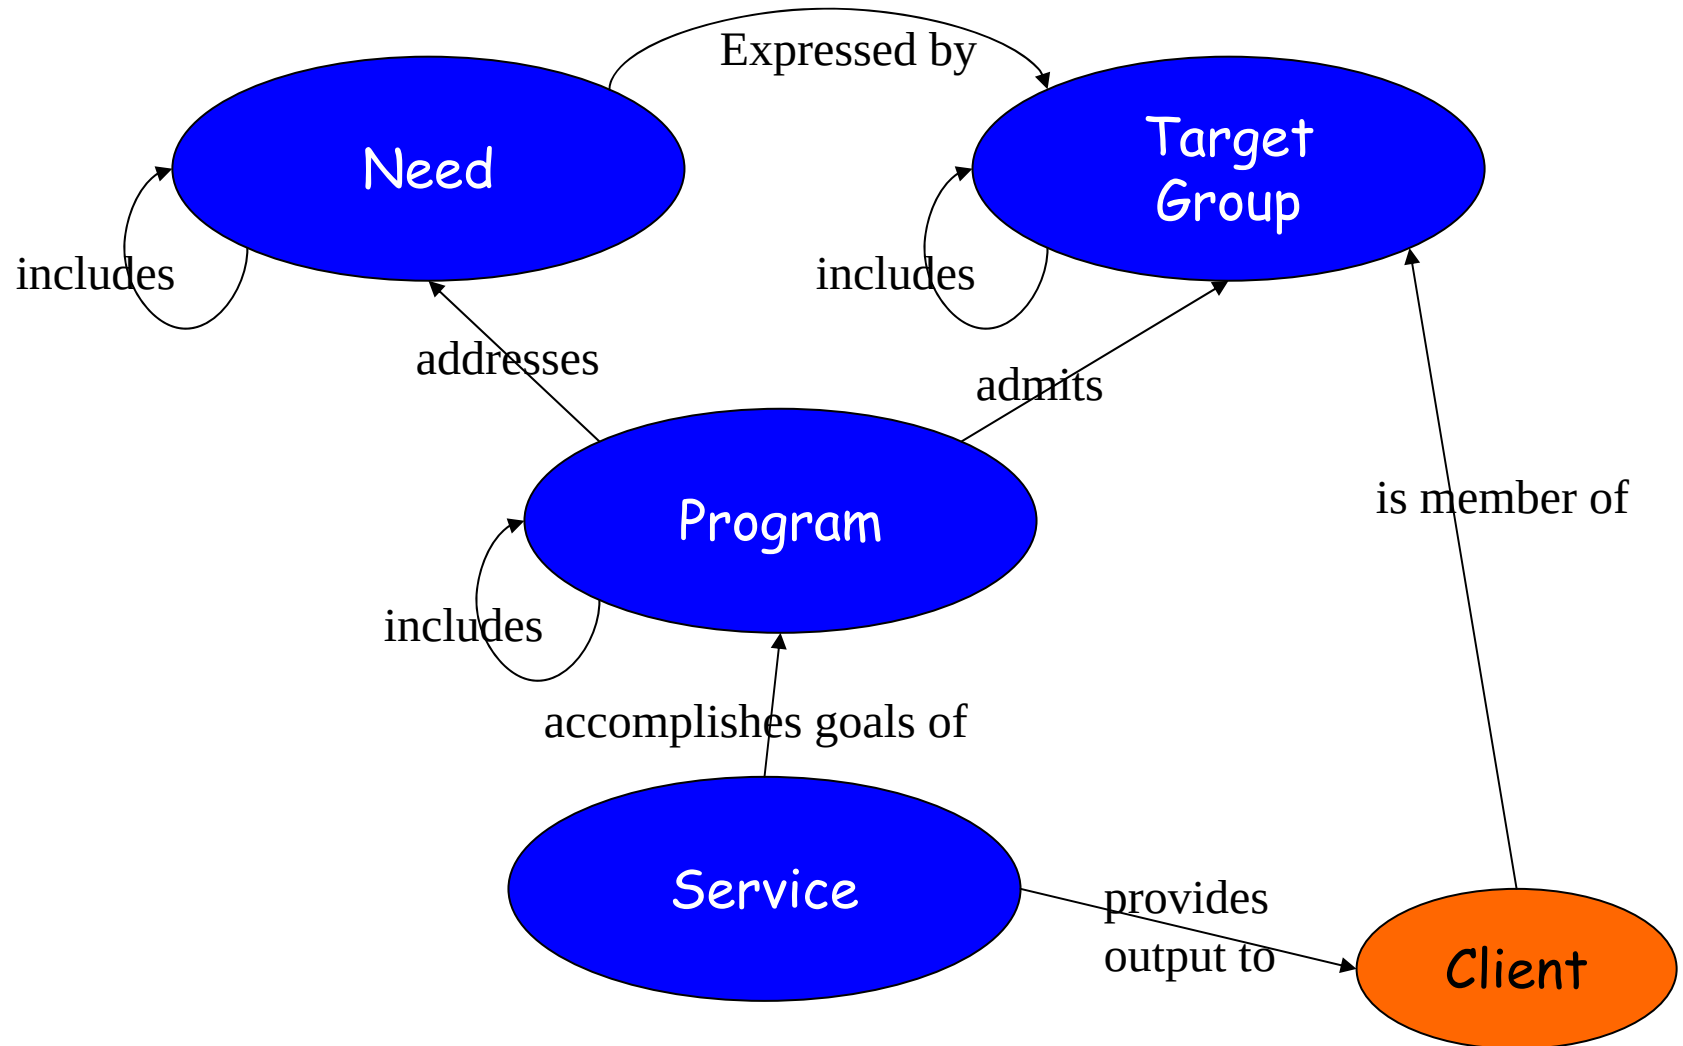

Metric		Efficiency Measures	Quality Measures	Effectiveness Measures
Def'n		$\frac{\text{Output Value}}{\text{Input Cost}}$	Comparison to Standards	Contribution to Higher Goal
Program	Workplace Safety	Total cost per capita	Meeting public expectations	Workplace safety trends
Service	Safety Certification	Average cost per certification	Certification accuracy & timeliness	Compliance & Accident trends
Process	Site Visit	Average cost per site visit	Site visit completeness & timeliness	Site visiting capabilities
Resource	Accident Reporting System	System cost per accident reported	System accuracy & timeliness	System capabilities

PROGRAM AND SERVICE ALIGNMENT

The diagram illustrates the 'Service Model' as a flow from Provider Organizations to Client Organizations. At the center is a red dashed circle containing the words 'Programs' and 'Services'. Arrows indicate the flow of various elements between the provider and client sides:

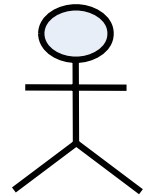

- Provider Organizations (Left):** Represented by a group of people. Associated terms include 'Roles', 'Accountability', 'Responsibility', and 'Authority'.
- Client Organizations (Right):** Represented by a group of people. Associated terms include 'Outcomes & Impacts' and 'Individual Clients'.
- Central Flow:**
 - Governance:** A red dotted arrow from the center to the Provider Organizations.
 - Outcomes & Impacts:** A red dotted arrow from the center to the Client Organizations.
 - Outputs:** A red dotted arrow from the center to the Client Organizations.
 - Processes:** A grey dashed arrow from the center to the bottom, labeled 'Used in'.
 - Resources:** A blue bold word at the bottom, connected to the 'Processes' arrow.
 - Accomplish:** A red dotted arrow from the center to the Provider Organizations.
 - Deliver:** A grey dashed arrow from the center to the Client Organizations.

Model of Programs and Services

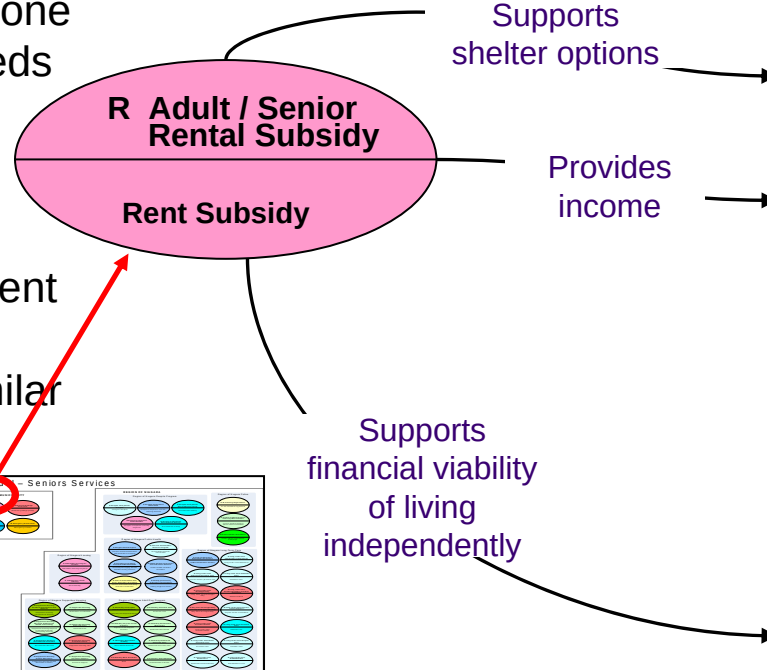

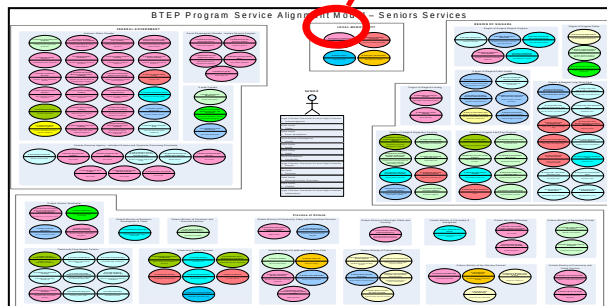

PSAM (Program Service Alignment Model)

SENIOR

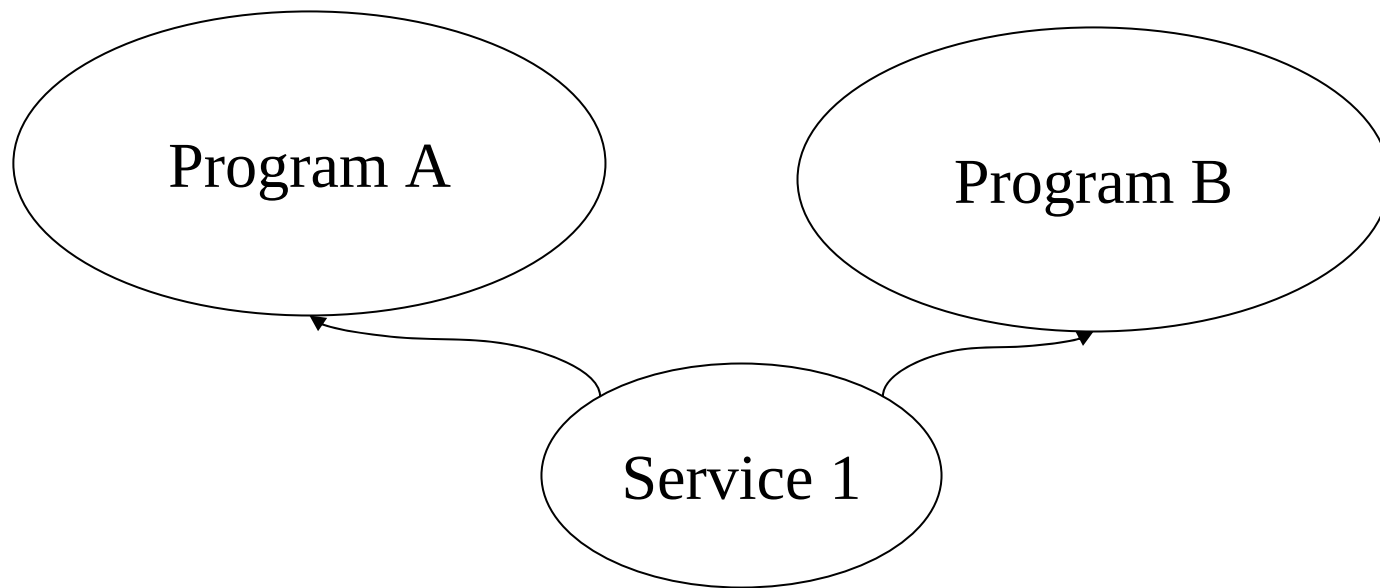

Explicitly identifies all programs & service directly satisfying one target group's needs

Identifies opportunities for service improvement e.g. where similar services meet similar needs

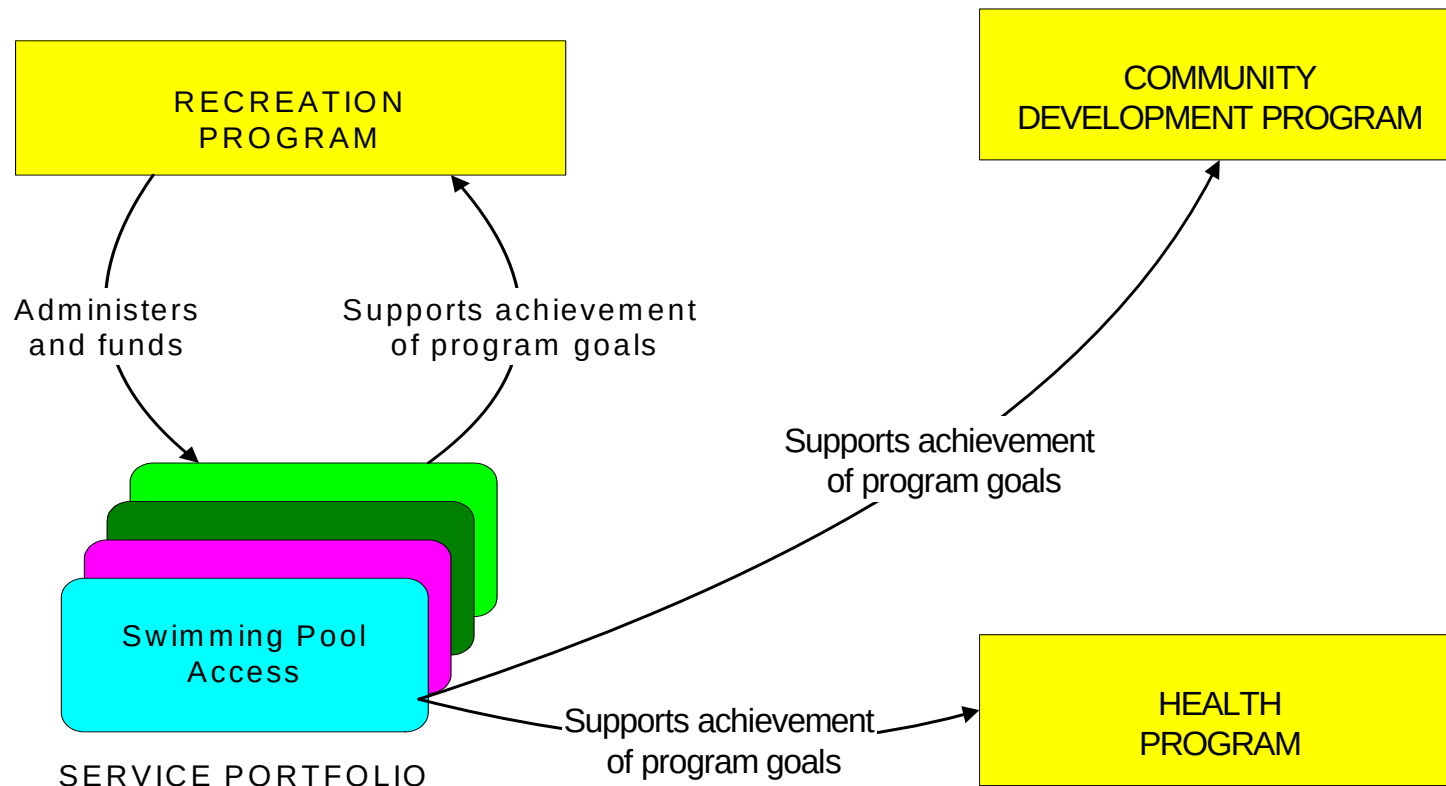

Program and Service Relationships

A service contributes to a program's goals by providing a valuable output to eligible members of the program's recognized target group, meeting a recognized need. Well-designed services meet multiple needs of multiple target groups in multiple programs.

Services May Provide Value to Multiple Programs

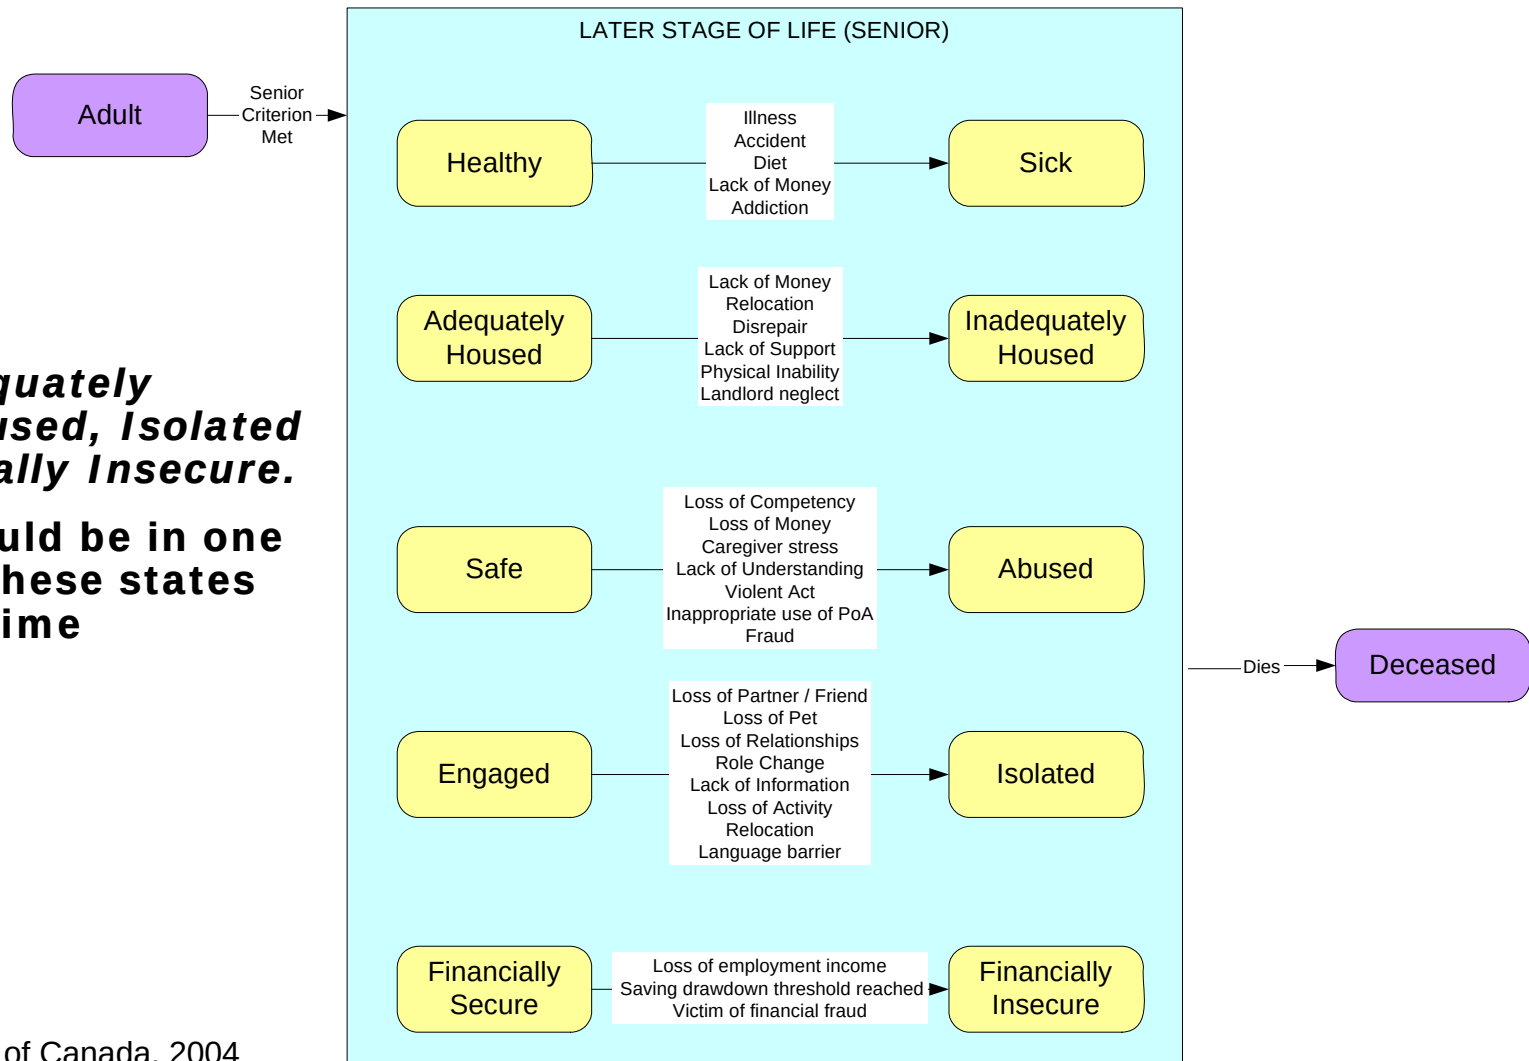

- What is the relative contribution to the other programs?
- What opportunities exist for co-funding?
- How does this influence the “real value” of the service?

Target Group State Transition Model

Example: Senior's state's and transitions

Sick, Inadequately housed, Abused, Isolated and Financially Insecure.

-A senior could be in one or more of these states at any one time

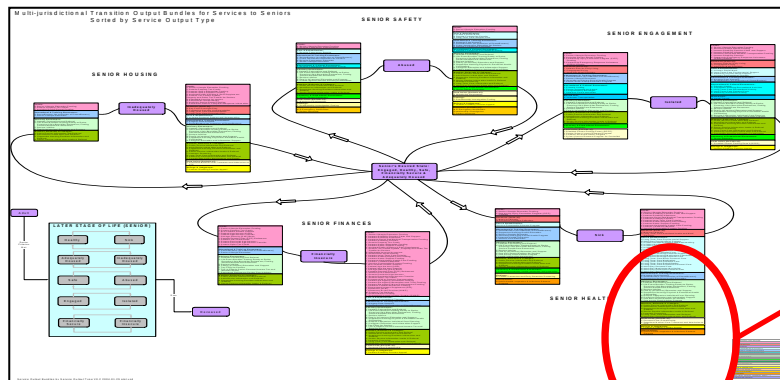

Example: Senior's Transition Output Bundle

Define “bundles” by identifying services that either support or inhibit transitions

Sets context for identifying opportunities, coordinating efforts and aligning performance across provider community

Shows services by output type or jurisdiction that must “fit together” to make a difference for the target group

HORIZONTAL SERVICE DESIGN

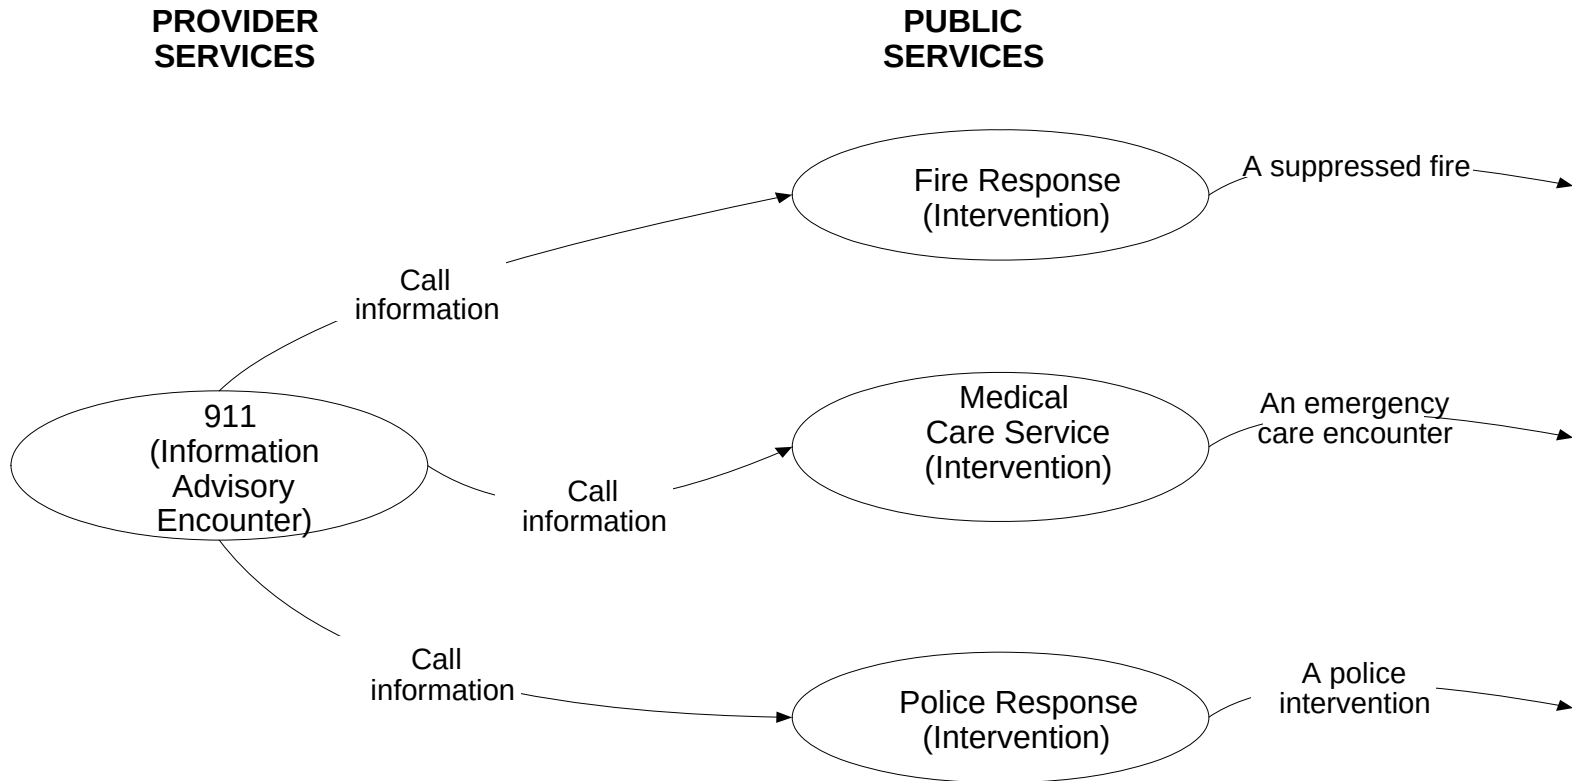

Service Integrated Accountability Model (SIAM)

A SIAM is a business model that depicts horizontal accountability relationships between a group of inter-related services and service providers. It is useful in setting the context for forming service agreements between parties and clarifying the respective service provision and client roles that parties play.

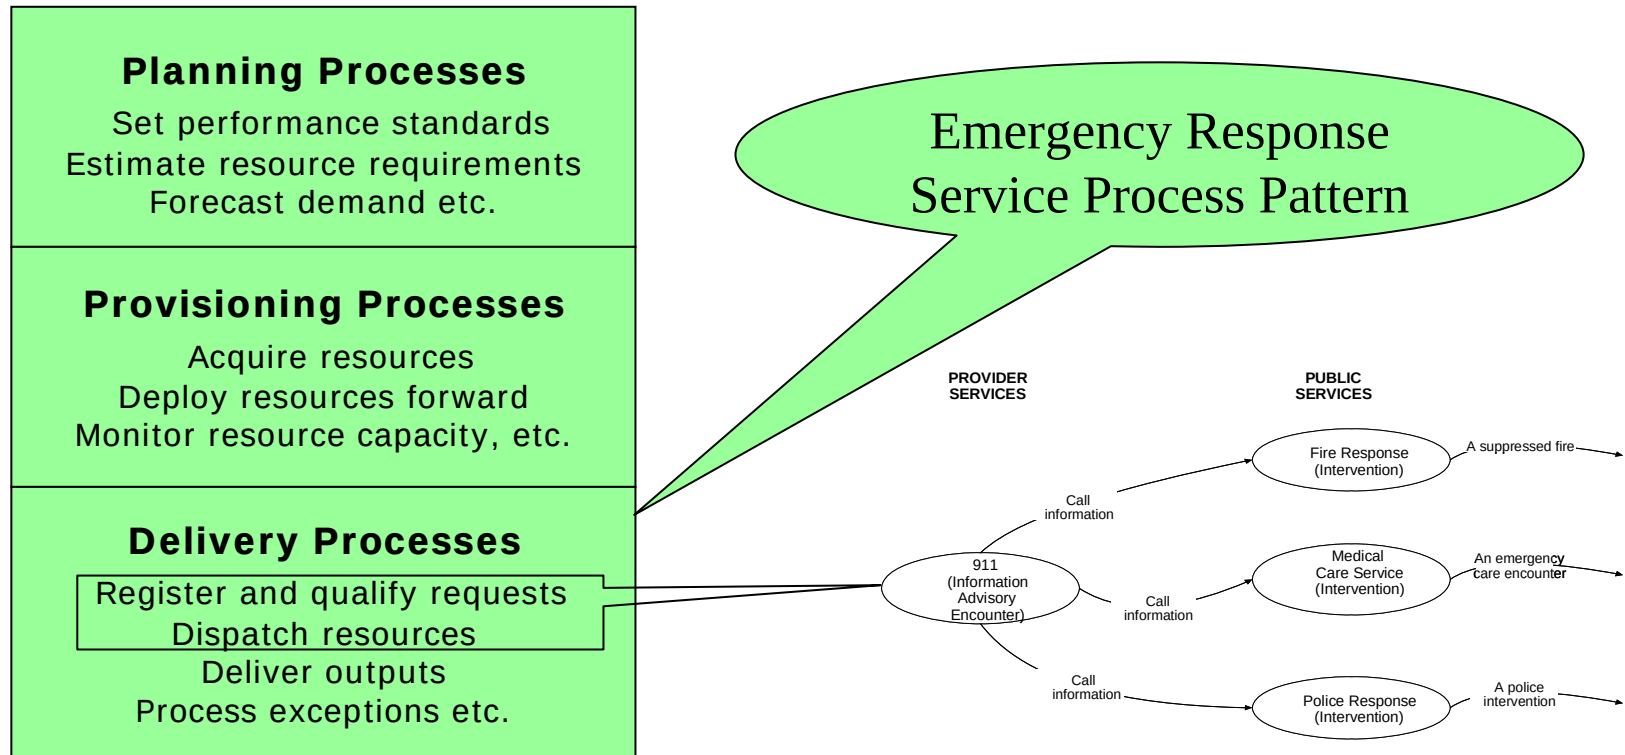

- An ellipse stands for a service and the arrow stands for the output of the service.
- The arrow represents an agreement related to an output, not a flow
- The recipient of the arrow is viewed as a 'client' who procures the service output as needed to support their own service delivery

Example - 911 Program SIAM

- The 911 service has “outsourced” or “hollowed out” the *call-taking* and *dispatch processes* of the emergency services; this is what provider services typically do!

SIAM Structure – provider services (“services to providers”) “outsource” processes in other provider’s services

Each service can be “opened up” to reveal the supporting processes

Question: How do we know what processes to outsource?

SIAM (Service Integration & Accountability Model)

- Focuses on concerns of program and policy managers - Useful for tracing horizontal accountability end-to-end between service providers
- Produces a business design that ensures completeness, i.e. all services required to achieve program and policy outcomes
- Produces a service design that is optimum in terms of identifying shared processes (enterprise manager/central agency concern)
- Ensures alignment of services, performance measures, accountabilities with organization structure and roles
 - E.g. identifies service level agreement requirements
- Provides strategic (enterprise) context for process and workflow modeling (no more silos!)
 - Can be managed at the enterprise level at a fraction of the cost of a process model

SIAM Introduction -1

Life Cycle

Planning

- Forecast Demand
- Determine ingredients

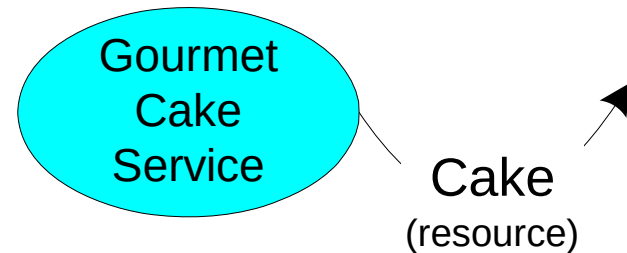

Provisioning

- Locate Suppliers
- Establish Facilities
- Monitor Quality

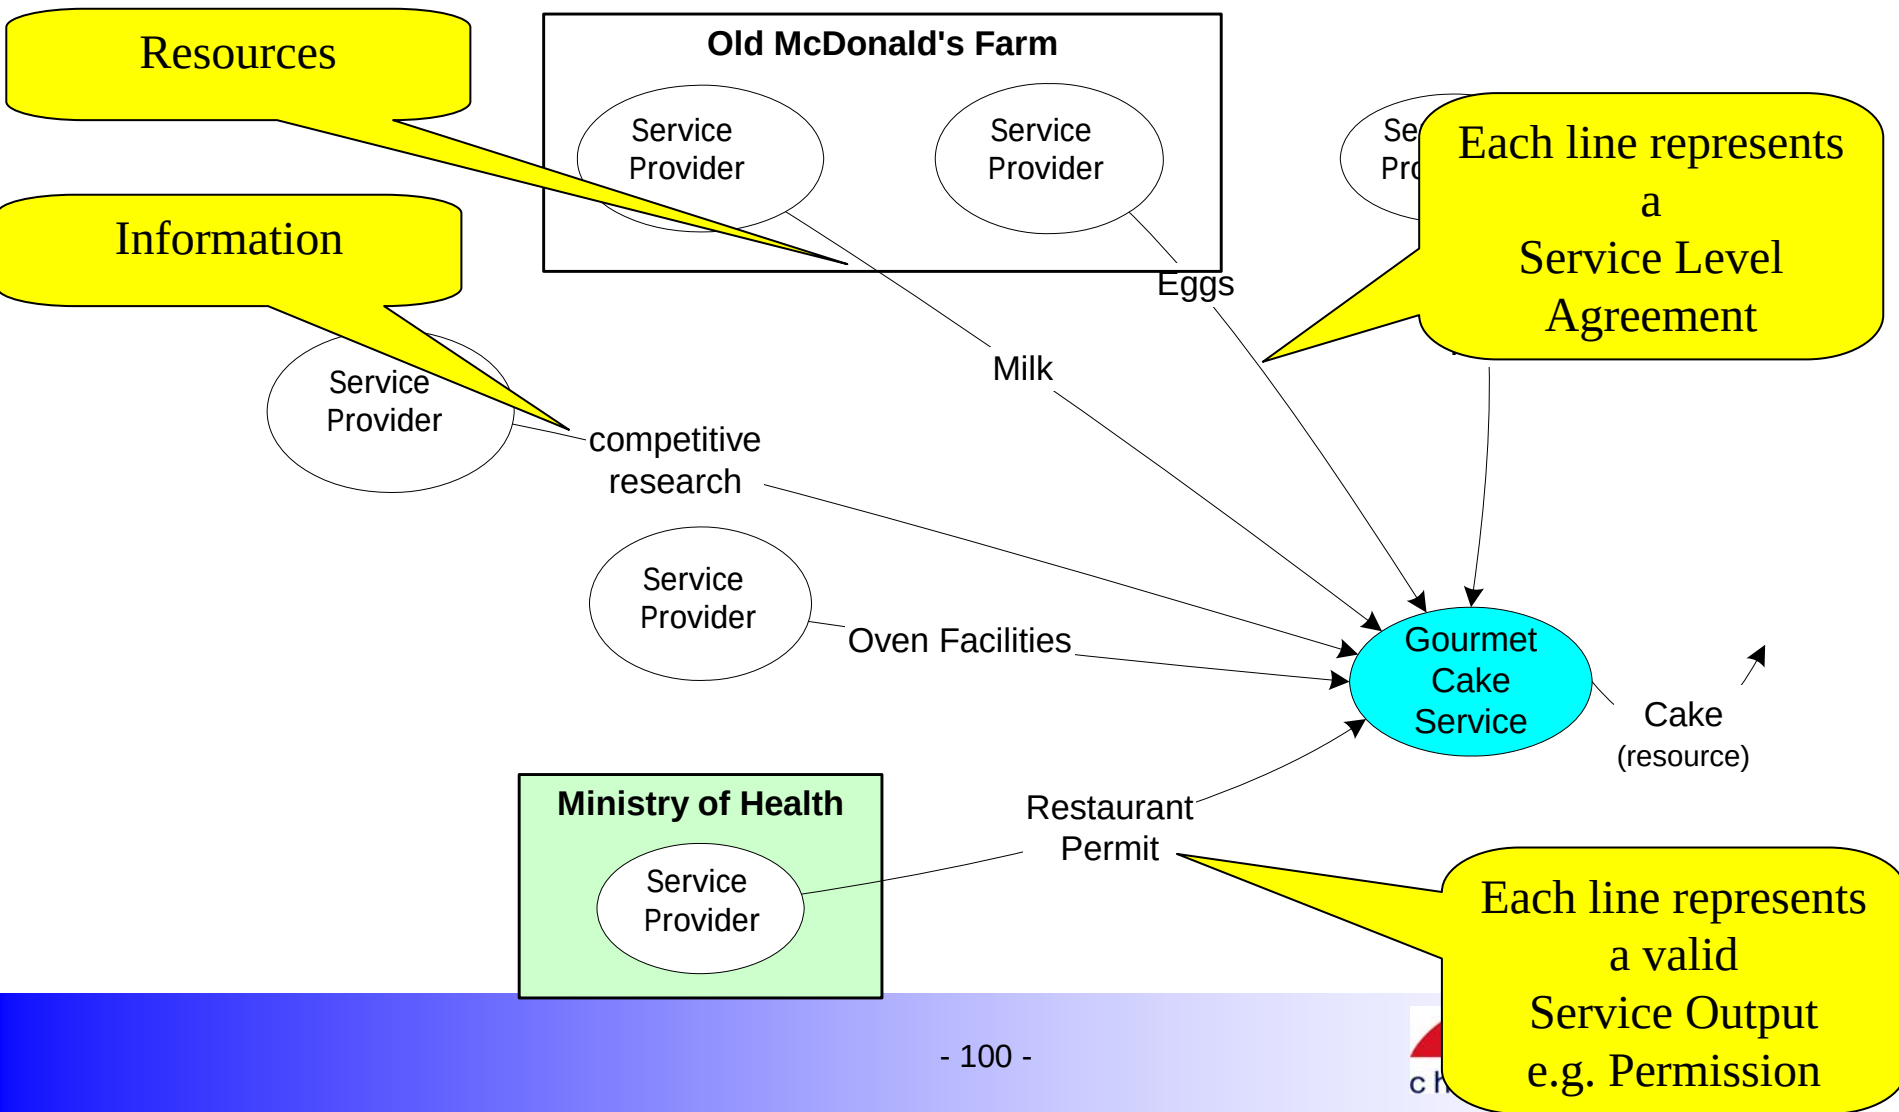

Delivery

- Accept orders
- Schedule staff
- Bake cakes
- Deliver Goods

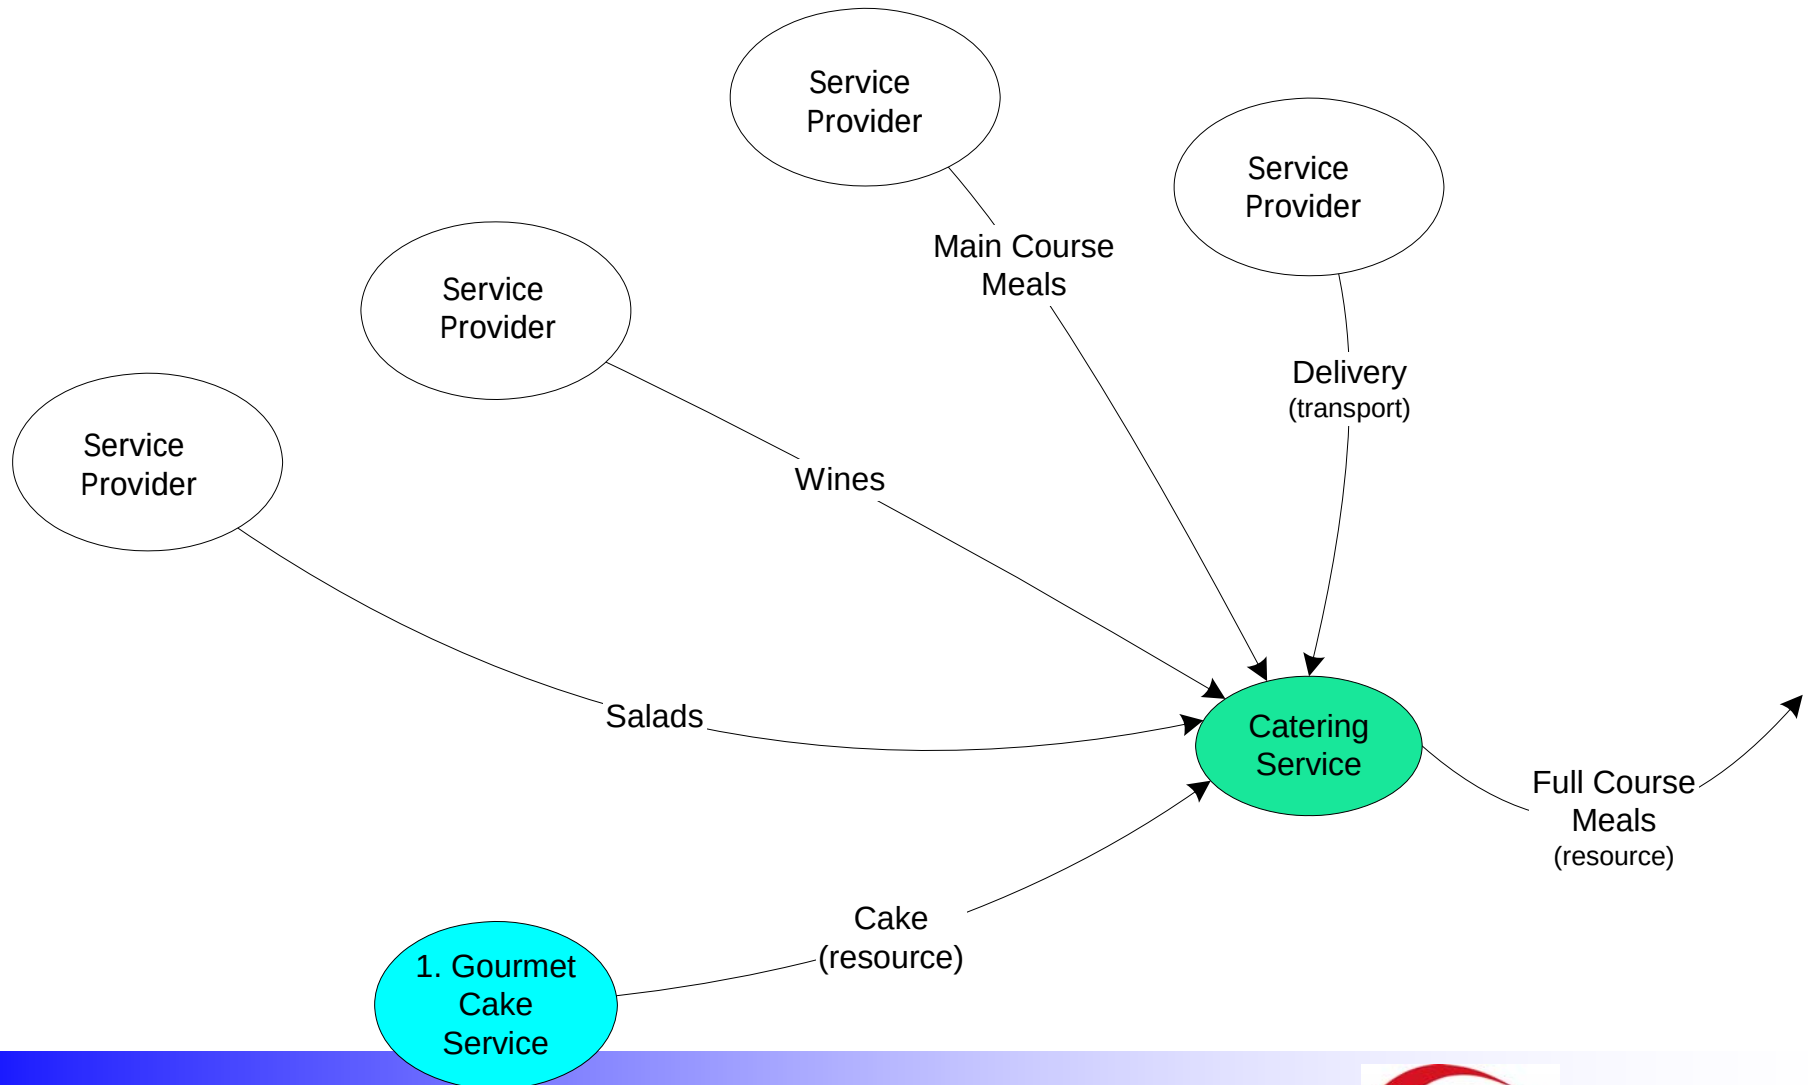

Decommissioning

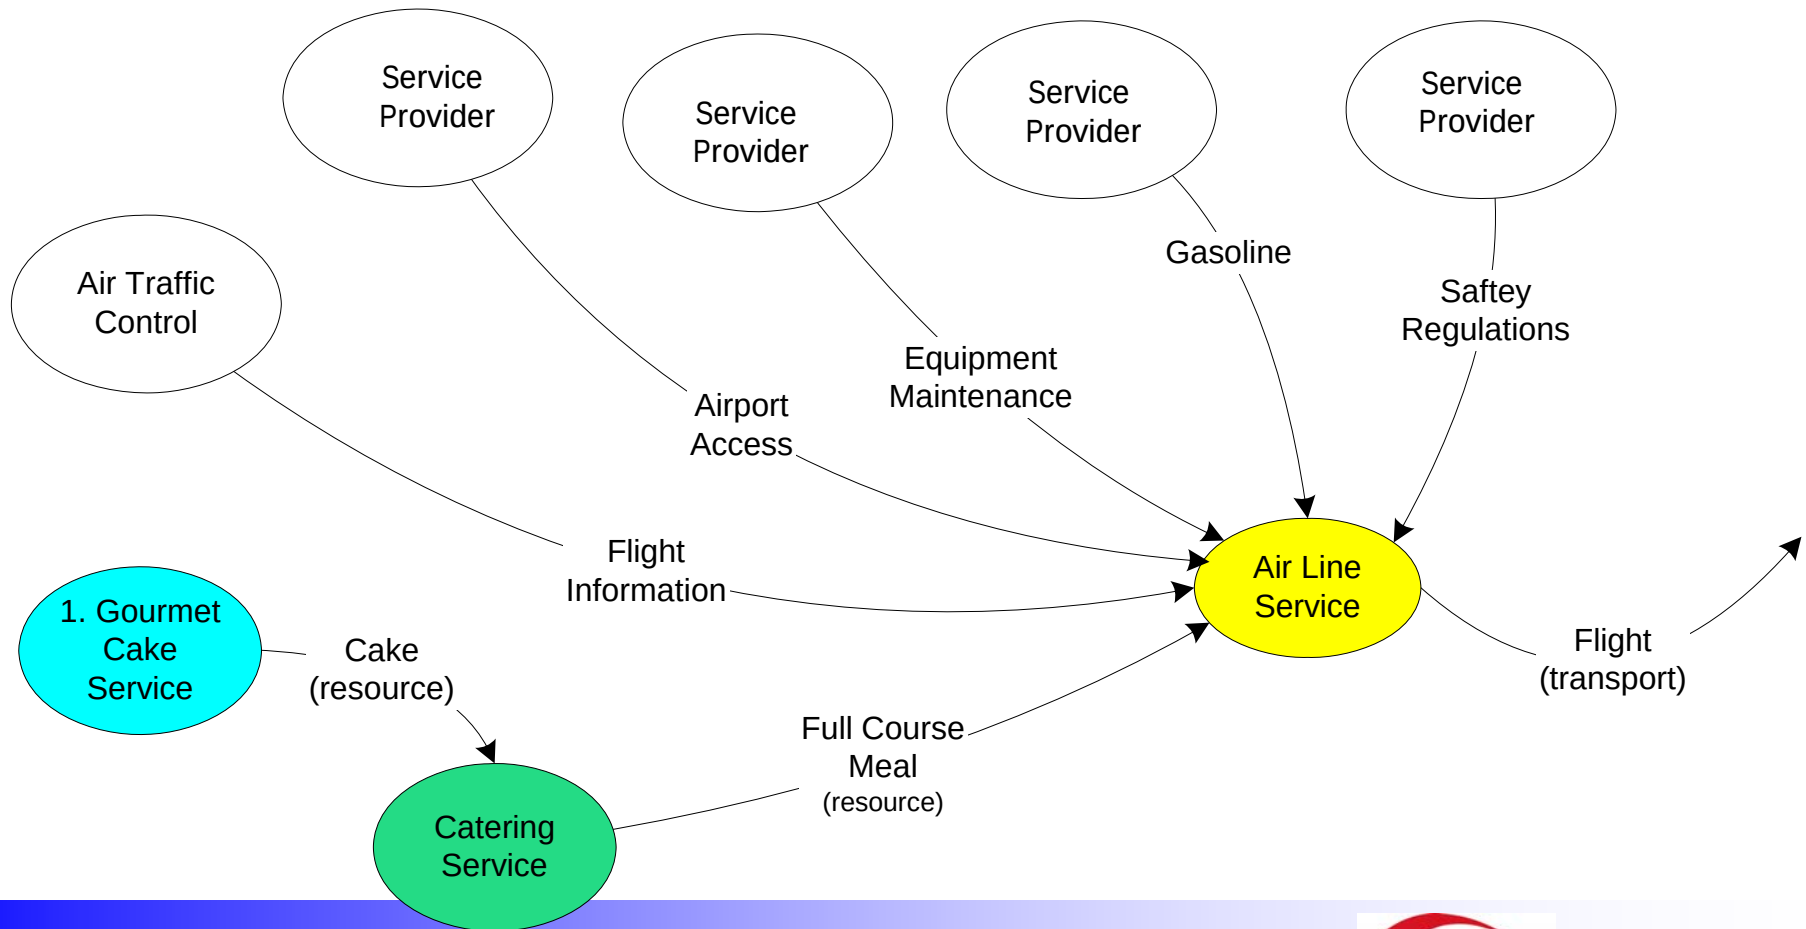

SIAM Introduction - 2

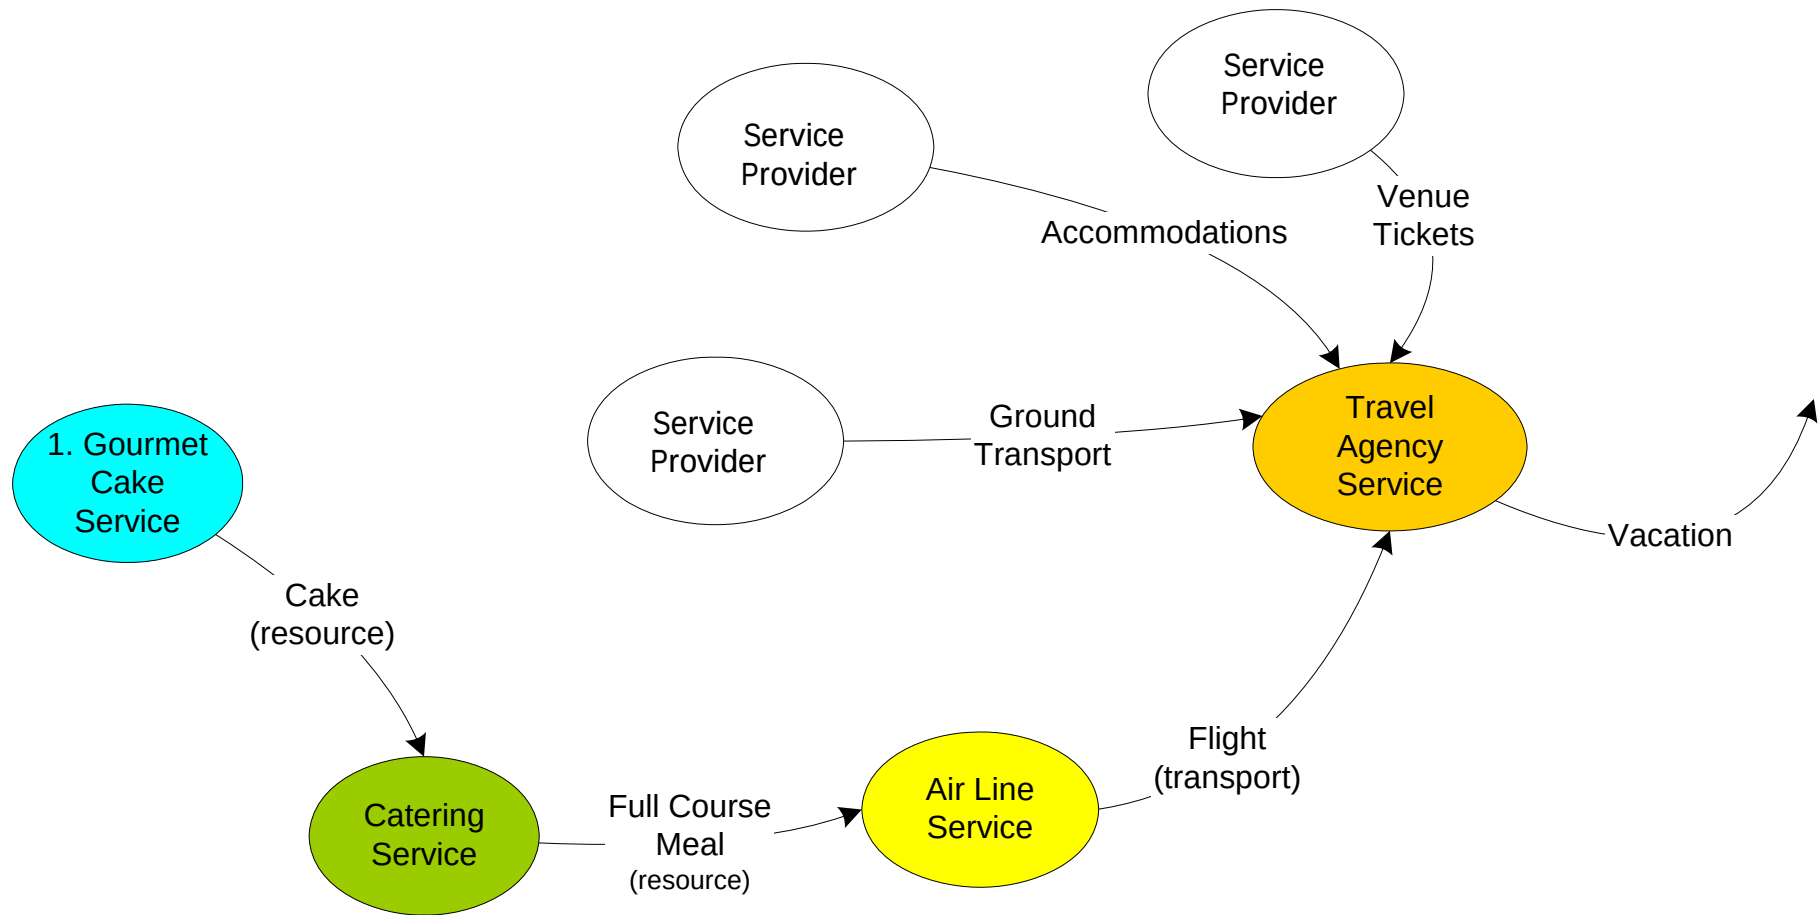

SIAM Introduction - 3

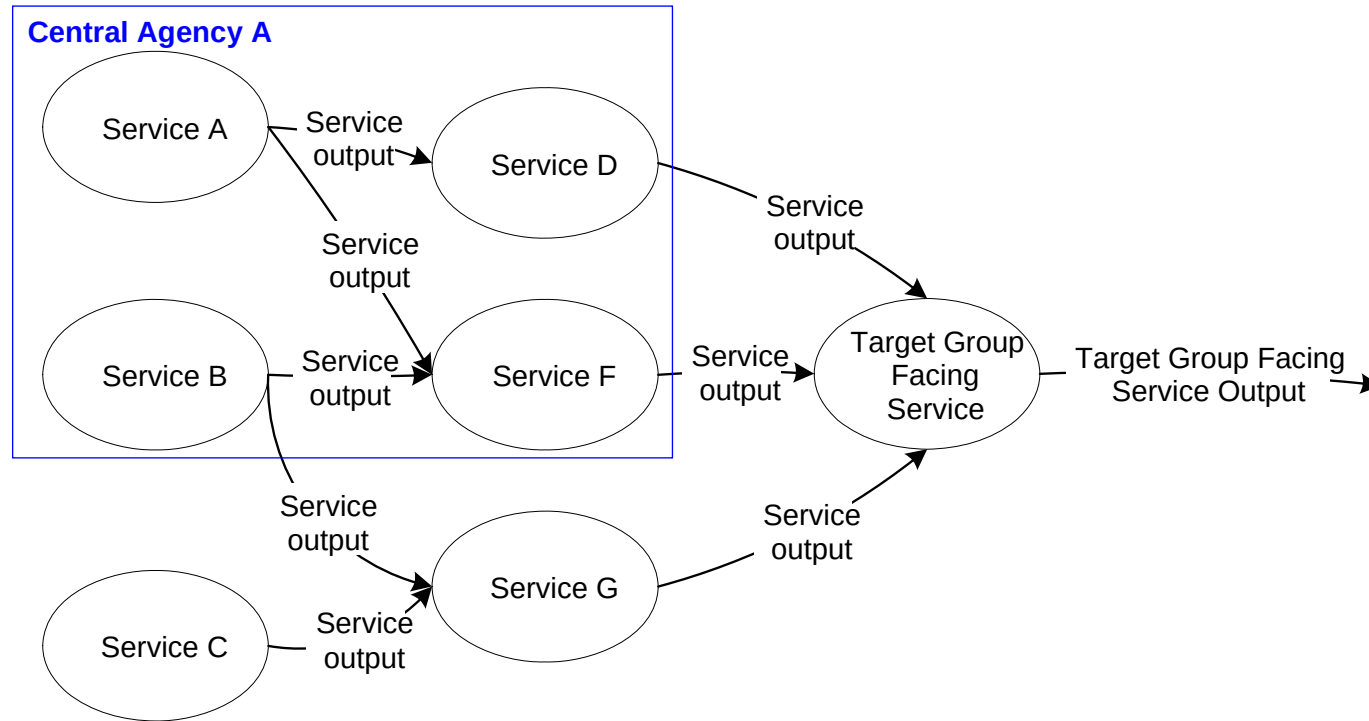

SIAM Introduction - 4

SIAM Introduction - 5

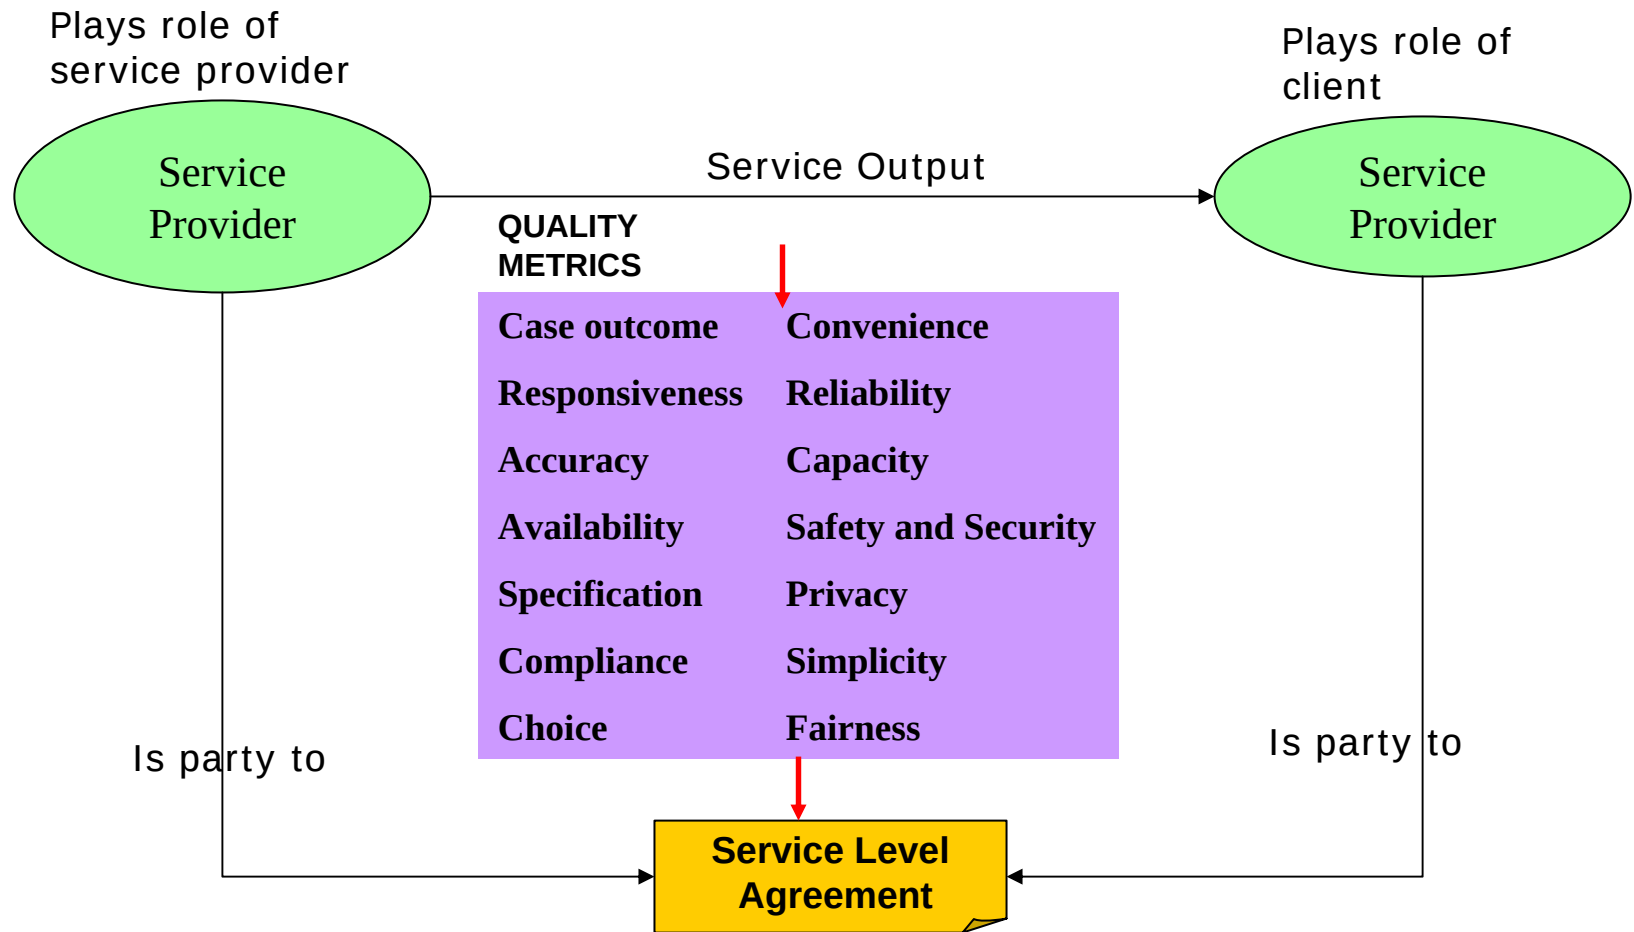

A SIAM Design Introduces organizational accountability to support exploring service design options.

What is Service Accountability?

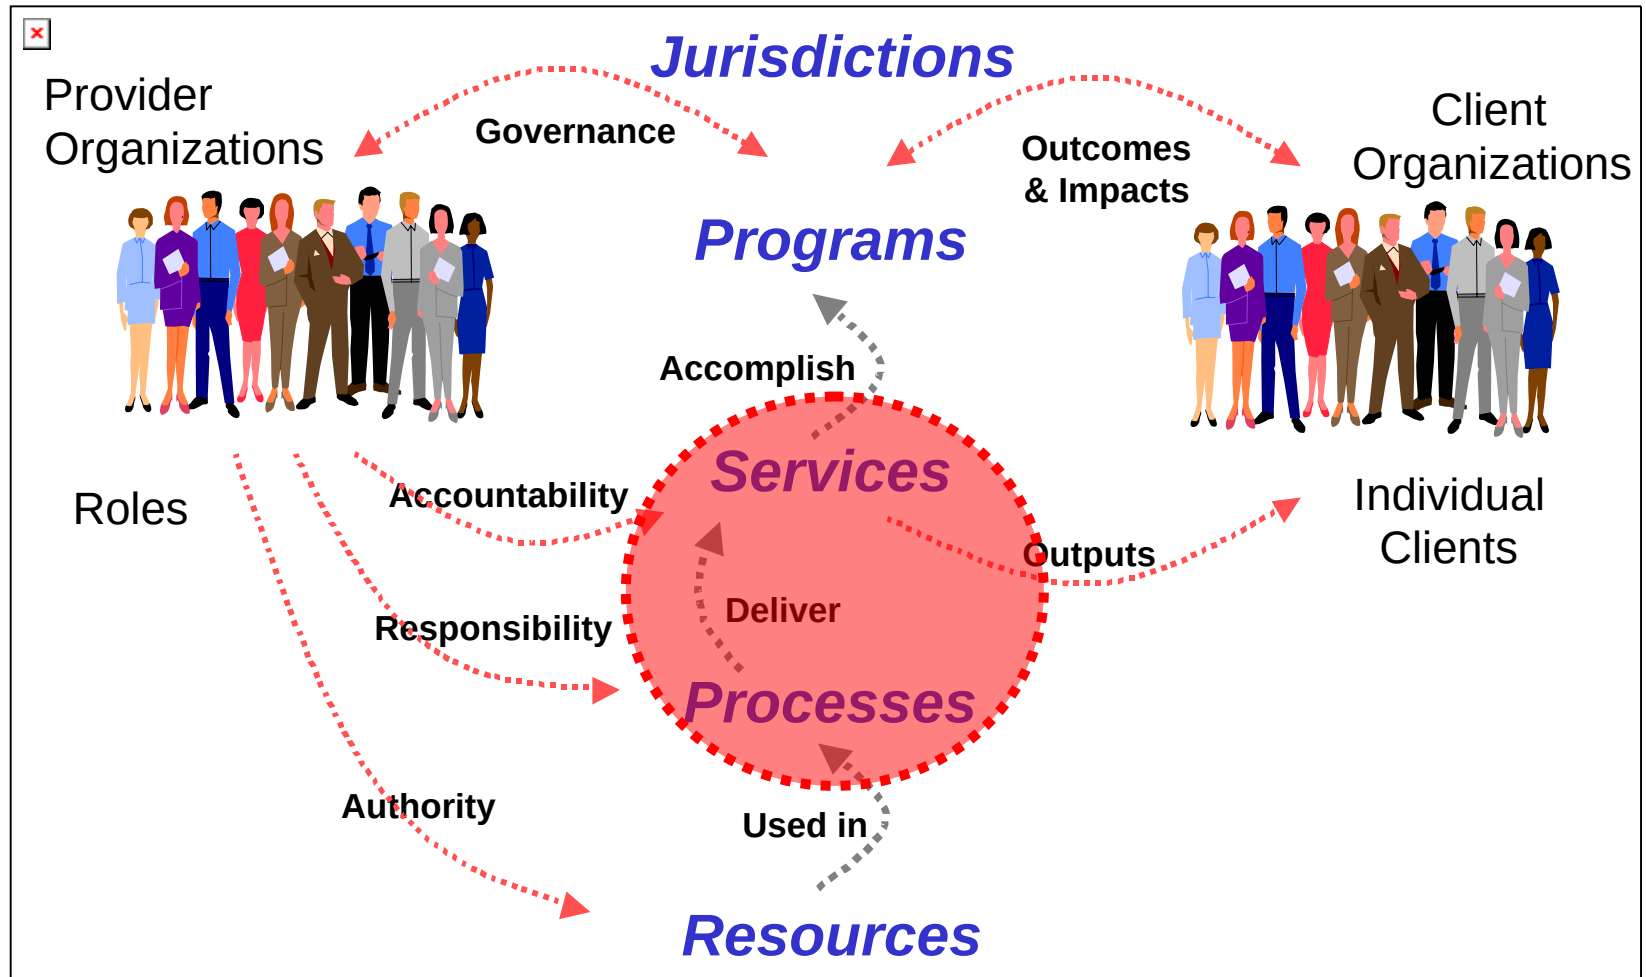

- A focus on results! Not the work itself!
- Service output performance metrics can be reported in three categories (EQE)
 - Efficiency - value of the output compared with costs of its inputs
 - Quality – comparison of a measure or dimension of the output to an established standard
 - Effectiveness – contribution of the output to an *outcome* (“desirable trend in the level of a client group’s need”)
- Service owners are:
 - Vertically accountable to their program owner for efficiency and effectiveness metrics
 - Horizontally accountable to their clients for quality metrics

Horizontal Service Level Agreements

Process and Work Design

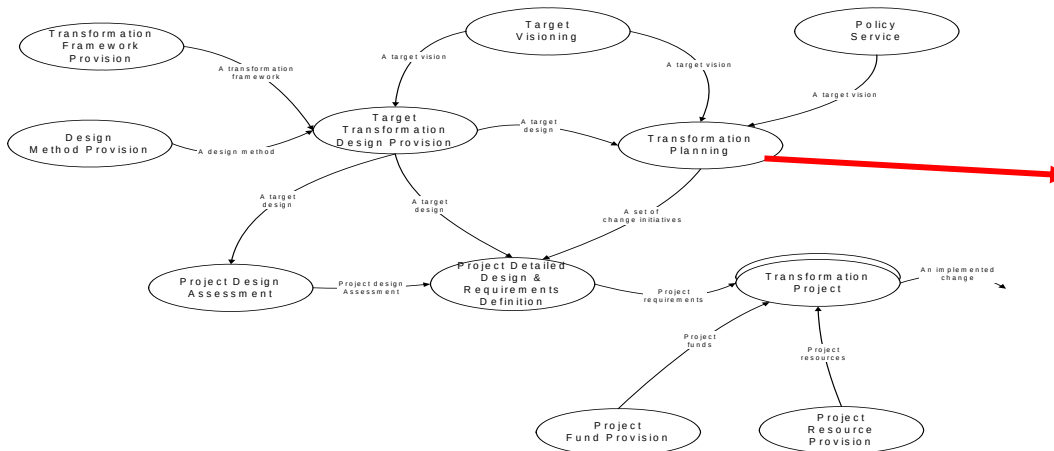

Program and Outcomes in Context

GSRM Process Definitions

- The GSRM defines a process as *a description of the work required to transform inputs to an output. When inputs are supplied and the process is performed, an output is produced and delivered.*
- The GSRM defines an output as *a work product.*

Service Process Model

Shows processes required to support services

Planning Processes

Set performance targets
Estimate resource requirements
Forecast demand etc.

Provisioning Processes

Acquire resources
Deploy resources
Monitor risks etc.

Delivery Processes

Register and qualify requests
Set schedule
Deliver outputs
Process exceptions etc.

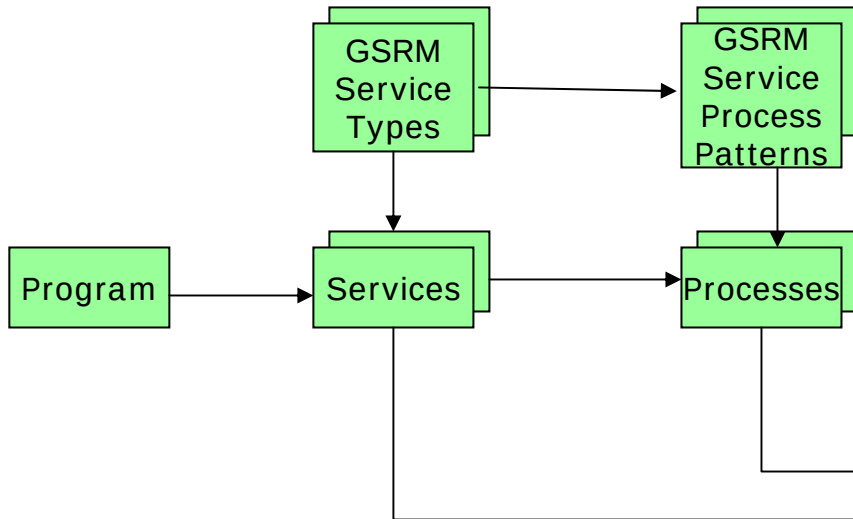

Decommissioning

Decommission service providers
Decommission resources etc.

Each service can be “opened up” to reveal the supporting processes

Question: Which roles in the service organization are responsible for which processes? Involved? Consulted Before? Informed After? etc

Use of GSRM to define processes in a program

All your processes in the program – Service Process **Wallpaper**

[illegible]

Model driven process definition is more scalable, efficient and flexible than traditional discovery based approaches.

GSRM Service Process Pattern Principles

- Each service type is associated with a pattern of processes to produce and deliver its corresponding service output type.
- In each service pattern, business processes are grouped into four categories because they operate on different cycles.
 - **Planning** processes describe the work of determining how the service will respond to demands. Planning processes operate on a planning cycle, or in response to a contingency.
 - **Provisioning** processes describe the work of preparing the service to respond to demands in accordance with plans. Provisioning processes operate in response to a routine draw-down of resources, or in a monitoring cycle, or in response to a contingency or required protective or stewardship action.
 - **Delivery** processes operate repeatedly when each request for a service output is received. These processes are called the service's "value chain" processes, because they fulfill the service requestor's essential purpose and the service recipient's essential intent.
 - **Decommissioning** processes recognize the lifecycles of resources, suppliers, service outputs, or service recipients and operate according to those lifecycle stages.

GSRM Service Process Pattern Principles (Cont'd)

- No sequence constraints are implied by the service process pattern.
 - One should imagine all these processes being carried out simultaneously during service operation.
 - Service process models define first the ‘inventory’ of processes associated with a service.
 - Note: Some of the processes will be executed by supporting service providers, some by roles internal to a given service organization.
- Individual processes in a service process pattern are guidelines.
 - May require customization to a given domain.
 - They should not be merged or the value of standard work partitioning will be lost.
- No scale is implied by the service process pattern.
 - These abstract processes have an interpretation for a service of any size.

Sample Service Process Model Wallpaper

Service Name	Detection and Analysis Service	Incident Response Service	Information Infrastructure Assessment Service	Infrastructure Defence Procedure Provision Service	Proactive Warning Service

Wallpaper – Program and Service Models Provide Context for Organizing Processes

Scoping Projects using Business Architecture

- OVERLAP: Does it represent risk or opportunity?
- May need to:
 - Elaborate processes in area of overlap
 - Explore other business architectural relationships
 - process to role responsibilities
 - process dependencies
 - process to resource

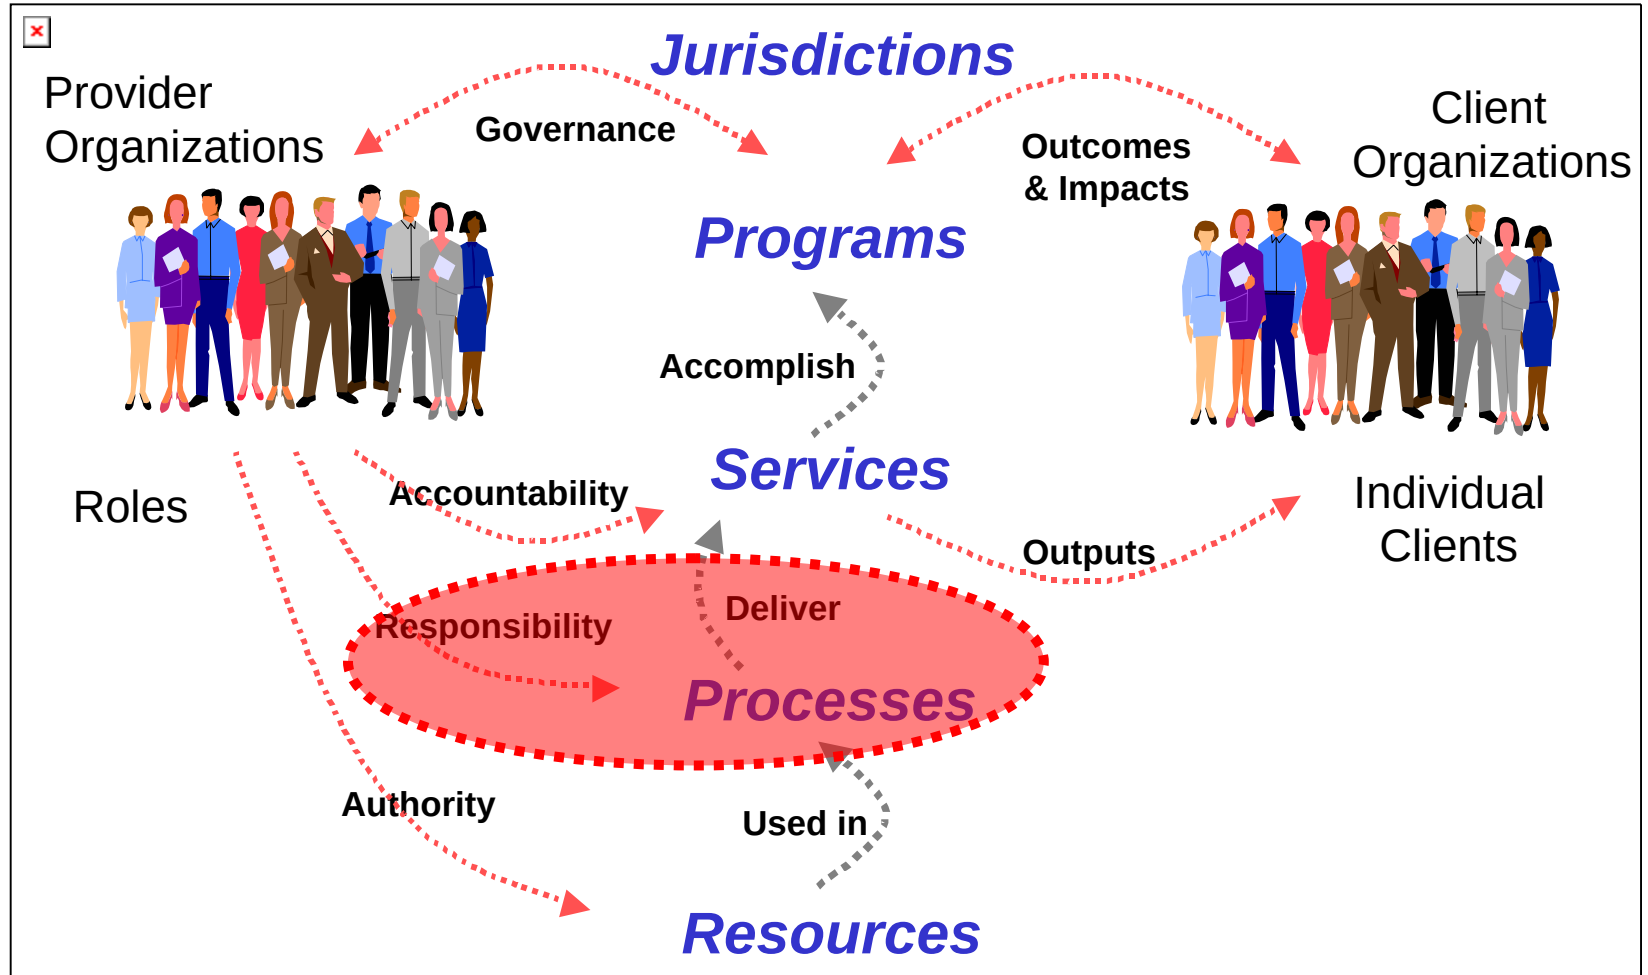

All your processes in the current program

Service 1	Service 2	Service 3	Service 4	Service 5	Service 6
Process	Process	Process	Process	Process	Process
Process	Process	Process	Process	Process	Process
Process	Process	Project B	Process	Process	Process

Process	Process		Process	Process	Process
Process	Process		Process	Process	Process
Process	Process		Process	Process	Process
Process	Process		Process	Process	Process
Process	Process		Process	Process	Process

- SCOPING
 - Define scope initially in terms of process / elaborate processes
 - Identify related business components:
 - Roles, resources, organizations, dependencies, performance measures,

Role Responsibility Models

Role Responsibility Models in Context

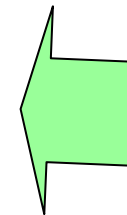

Defining Internal Responsibilities

Role Responsibility Mapping

As a test, you pick a handful of key processes and map to the roles using your defined relationships.

	Registrar	Admin. Coordinator	Instructor	Records Mgr
Capture client request		R		R I
Determine eligibility	R	I		
Register client	R	I		I
Notify clients of schedule	A	R		
Allocate resources to courses	R			
Deliver training		I	R	
Collect fee	A			

Sample
Roles

Overlap! More
than one role is
responsible

Gap! No role is
responsible

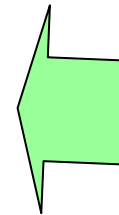

Sample Delivery processes

R – Responsible for
A – Approves
I – Involved

Defining Internal Responsibilities

	Registrar	Admin. Coordinator	Instructor	Records Mgr
Capture client request		R		I
Determine eligibility	R	I		
Register client	R	I		I
Notify clients of schedule	A	R		
Allocate resources to courses	R			
Deliver training		I	R	
Collect fee	A	R		

Sample
Roles

The vertical relationships provide the basis for formal role definitions.

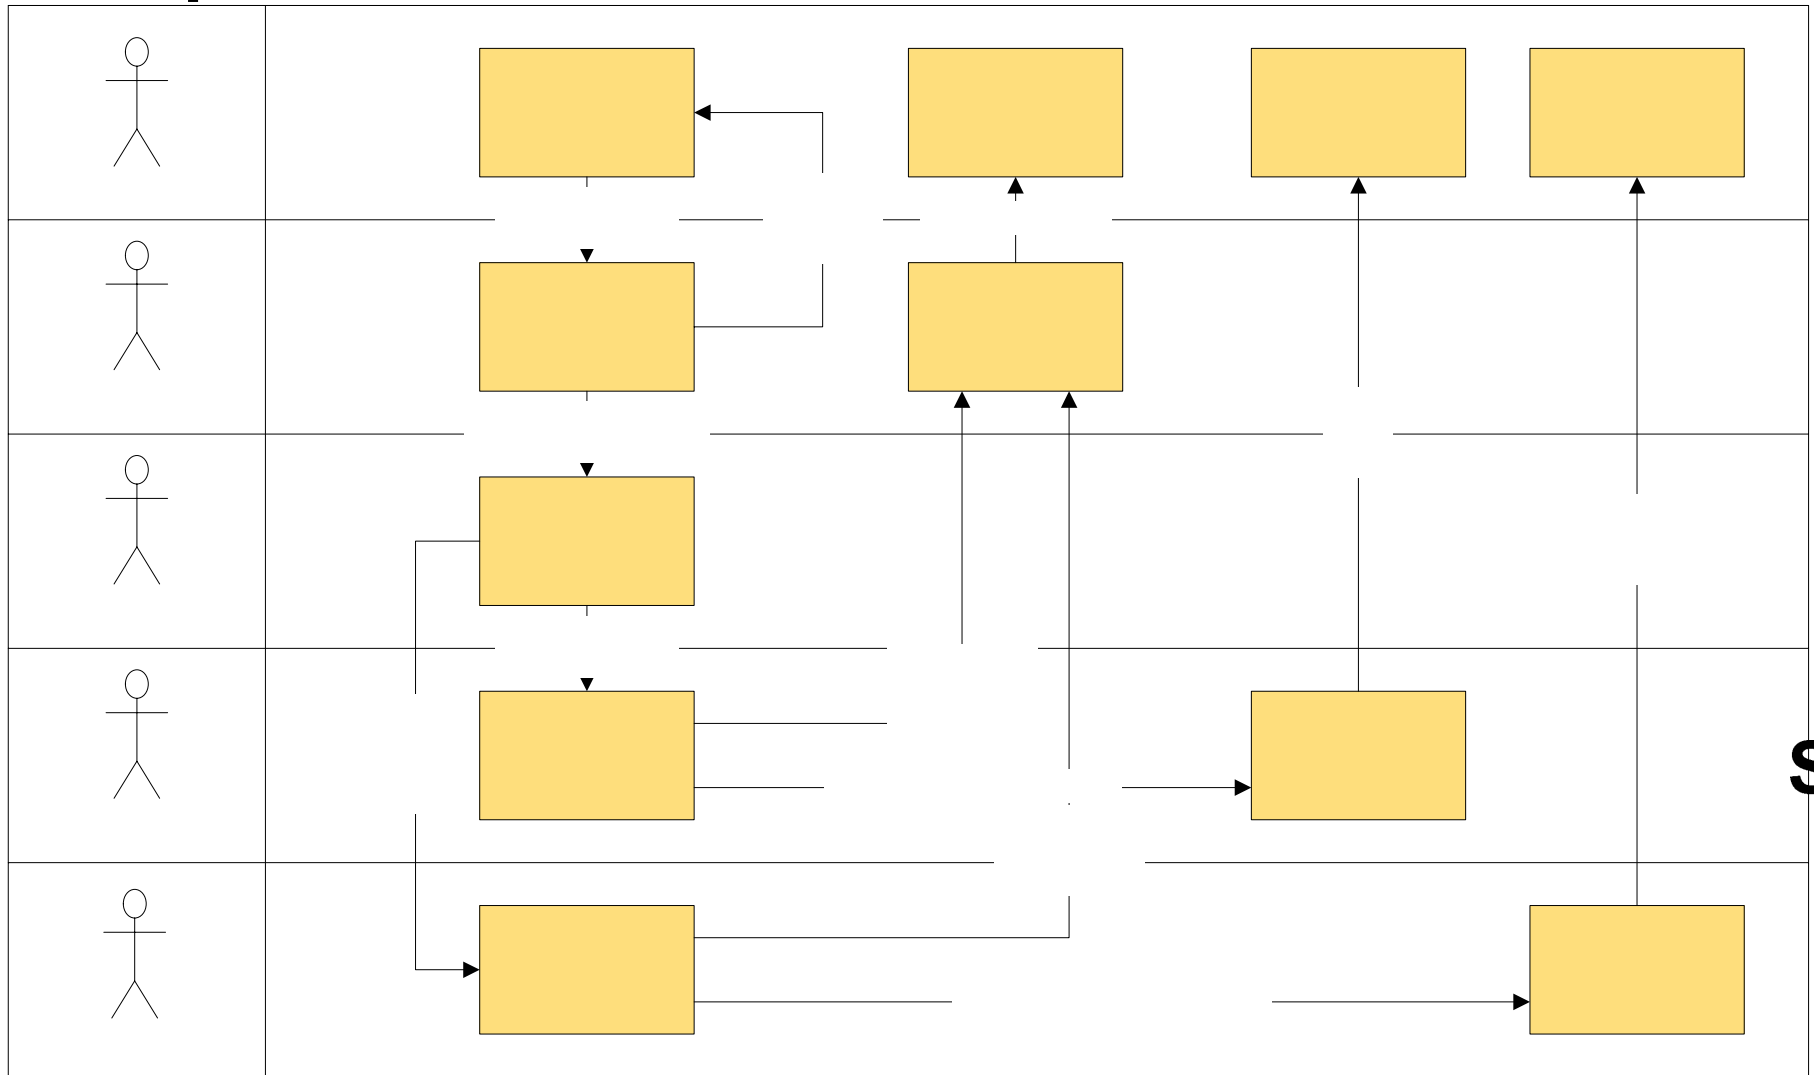

Horizontal relationships give an integrated stakeholder view of process. Prelude to workflow design

Sample Delivery processes

R – Responsible for
A – Approves
I – Involved

Sample Workflow Model

Customer

Summary and Discussion

Summary Points

- Business design is required to support effective government change
- Government 'open-source' public sector reference models (as GSRM) support business designs that are integrated, aligned, reusable and sharable across traditional boundaries
- Market awareness of approach and number of success stories are growing
- Full scale adoption requires capability maturity strategy and governance
