

going mobile

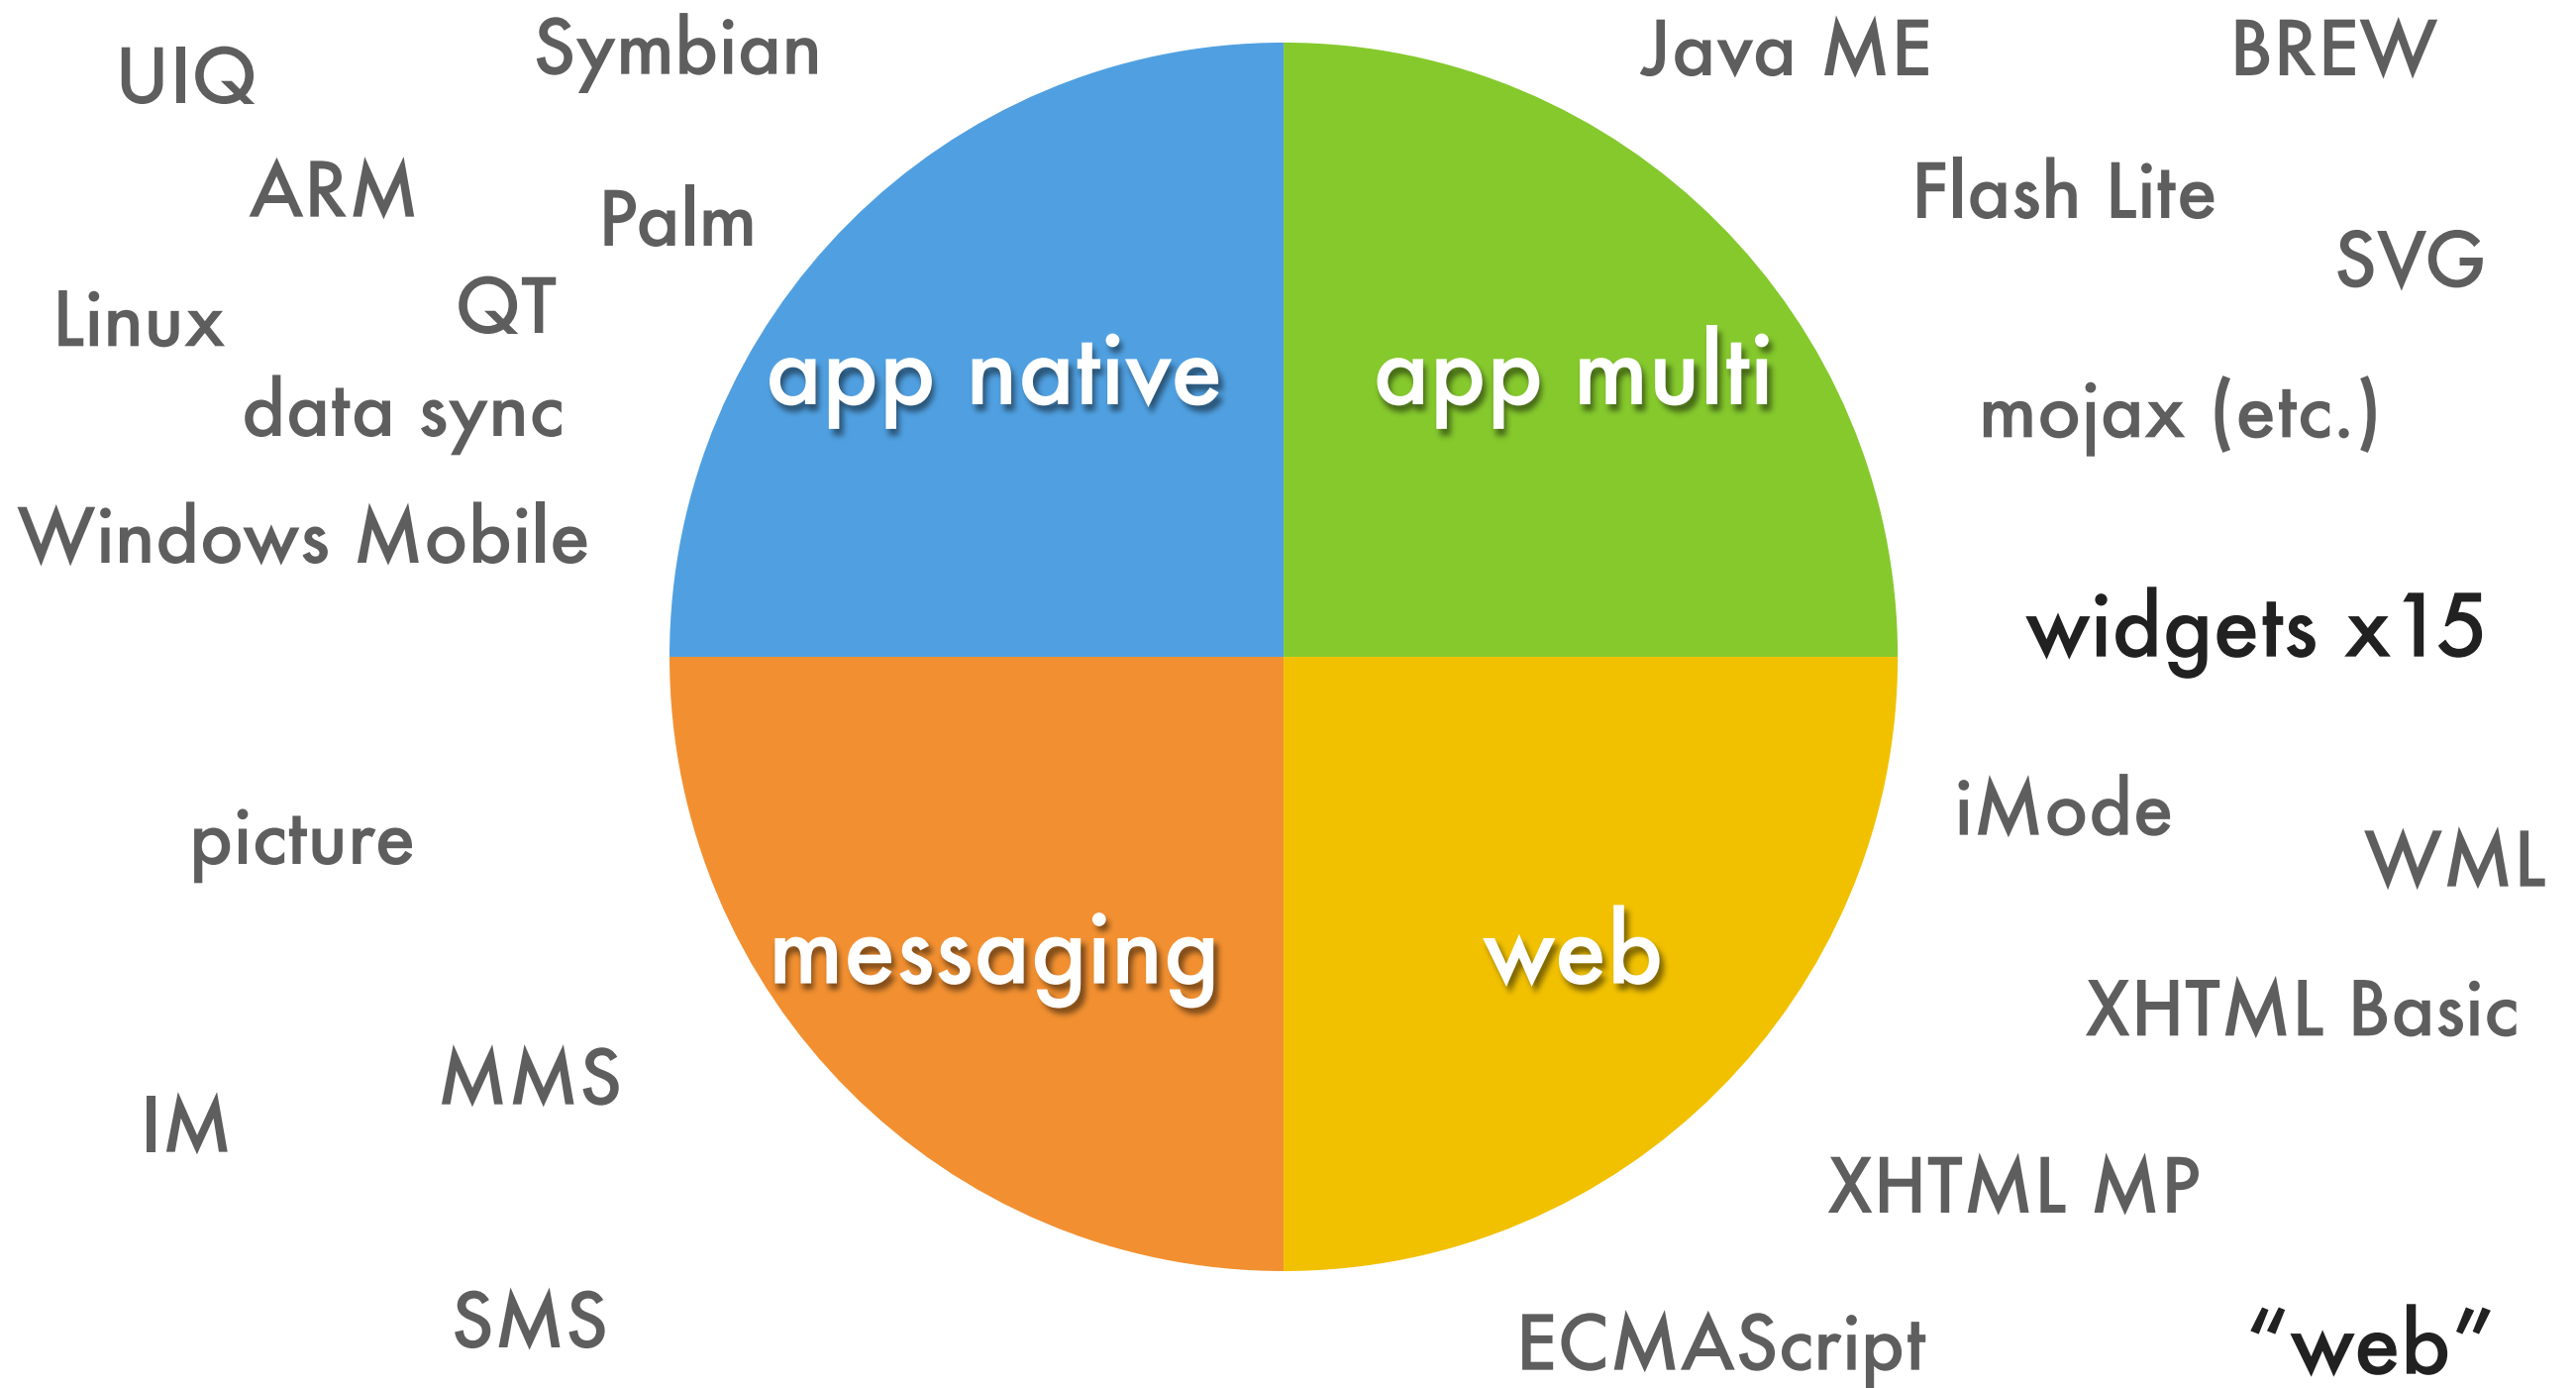

choosing target devices & platforms

development options

typical thinking

“Let’s design for the RAZR”

“Our market is all phones”

“Let’s design for the RAZR”

“It’s gotta work on iPhone”

"Our market is all phones"

"Smart phones are key"

"Let's design for the RAZR"

"Java is a nightmare"

"It's gotta work on iPhone"

"Java is the best answer"

needs-based thinking

a selection methodology

- **class** of technology based on application & user needs
 - native, cross-device app, web, messaging
- **specifics** of technology based on market, distribution, and internal company needs
 - Java, BREW, web, scripting, Symbian, etc.

mobile needs come from

- users & context
- distribution: on / off deck; market
- device & platform capabilities
- necessary application behavior
- data needs
- the carry principle

fashion
statement

personal
device

specialized

multipurpose

reflection
of personality

*device
proliferation*

communications
focus

the carry principle
a user's mobile phone is always carried

battery
powered

small screen

inconsistent
connectivity

difficult text
entry

1 handed
operation

application & user needs

interaction needs

- **reliability** of data access
- interaction **flow**
- **glanceability** of data
- **freshness** of data
- interaction **richness**

data access reliability

present
unless
device
lost

calendar

app native

contacts

app multi

present
unless
device
lost

could
be
delayed

messaging

Twitter

search

w

only when
data access

roaming
air travel
coverage hole

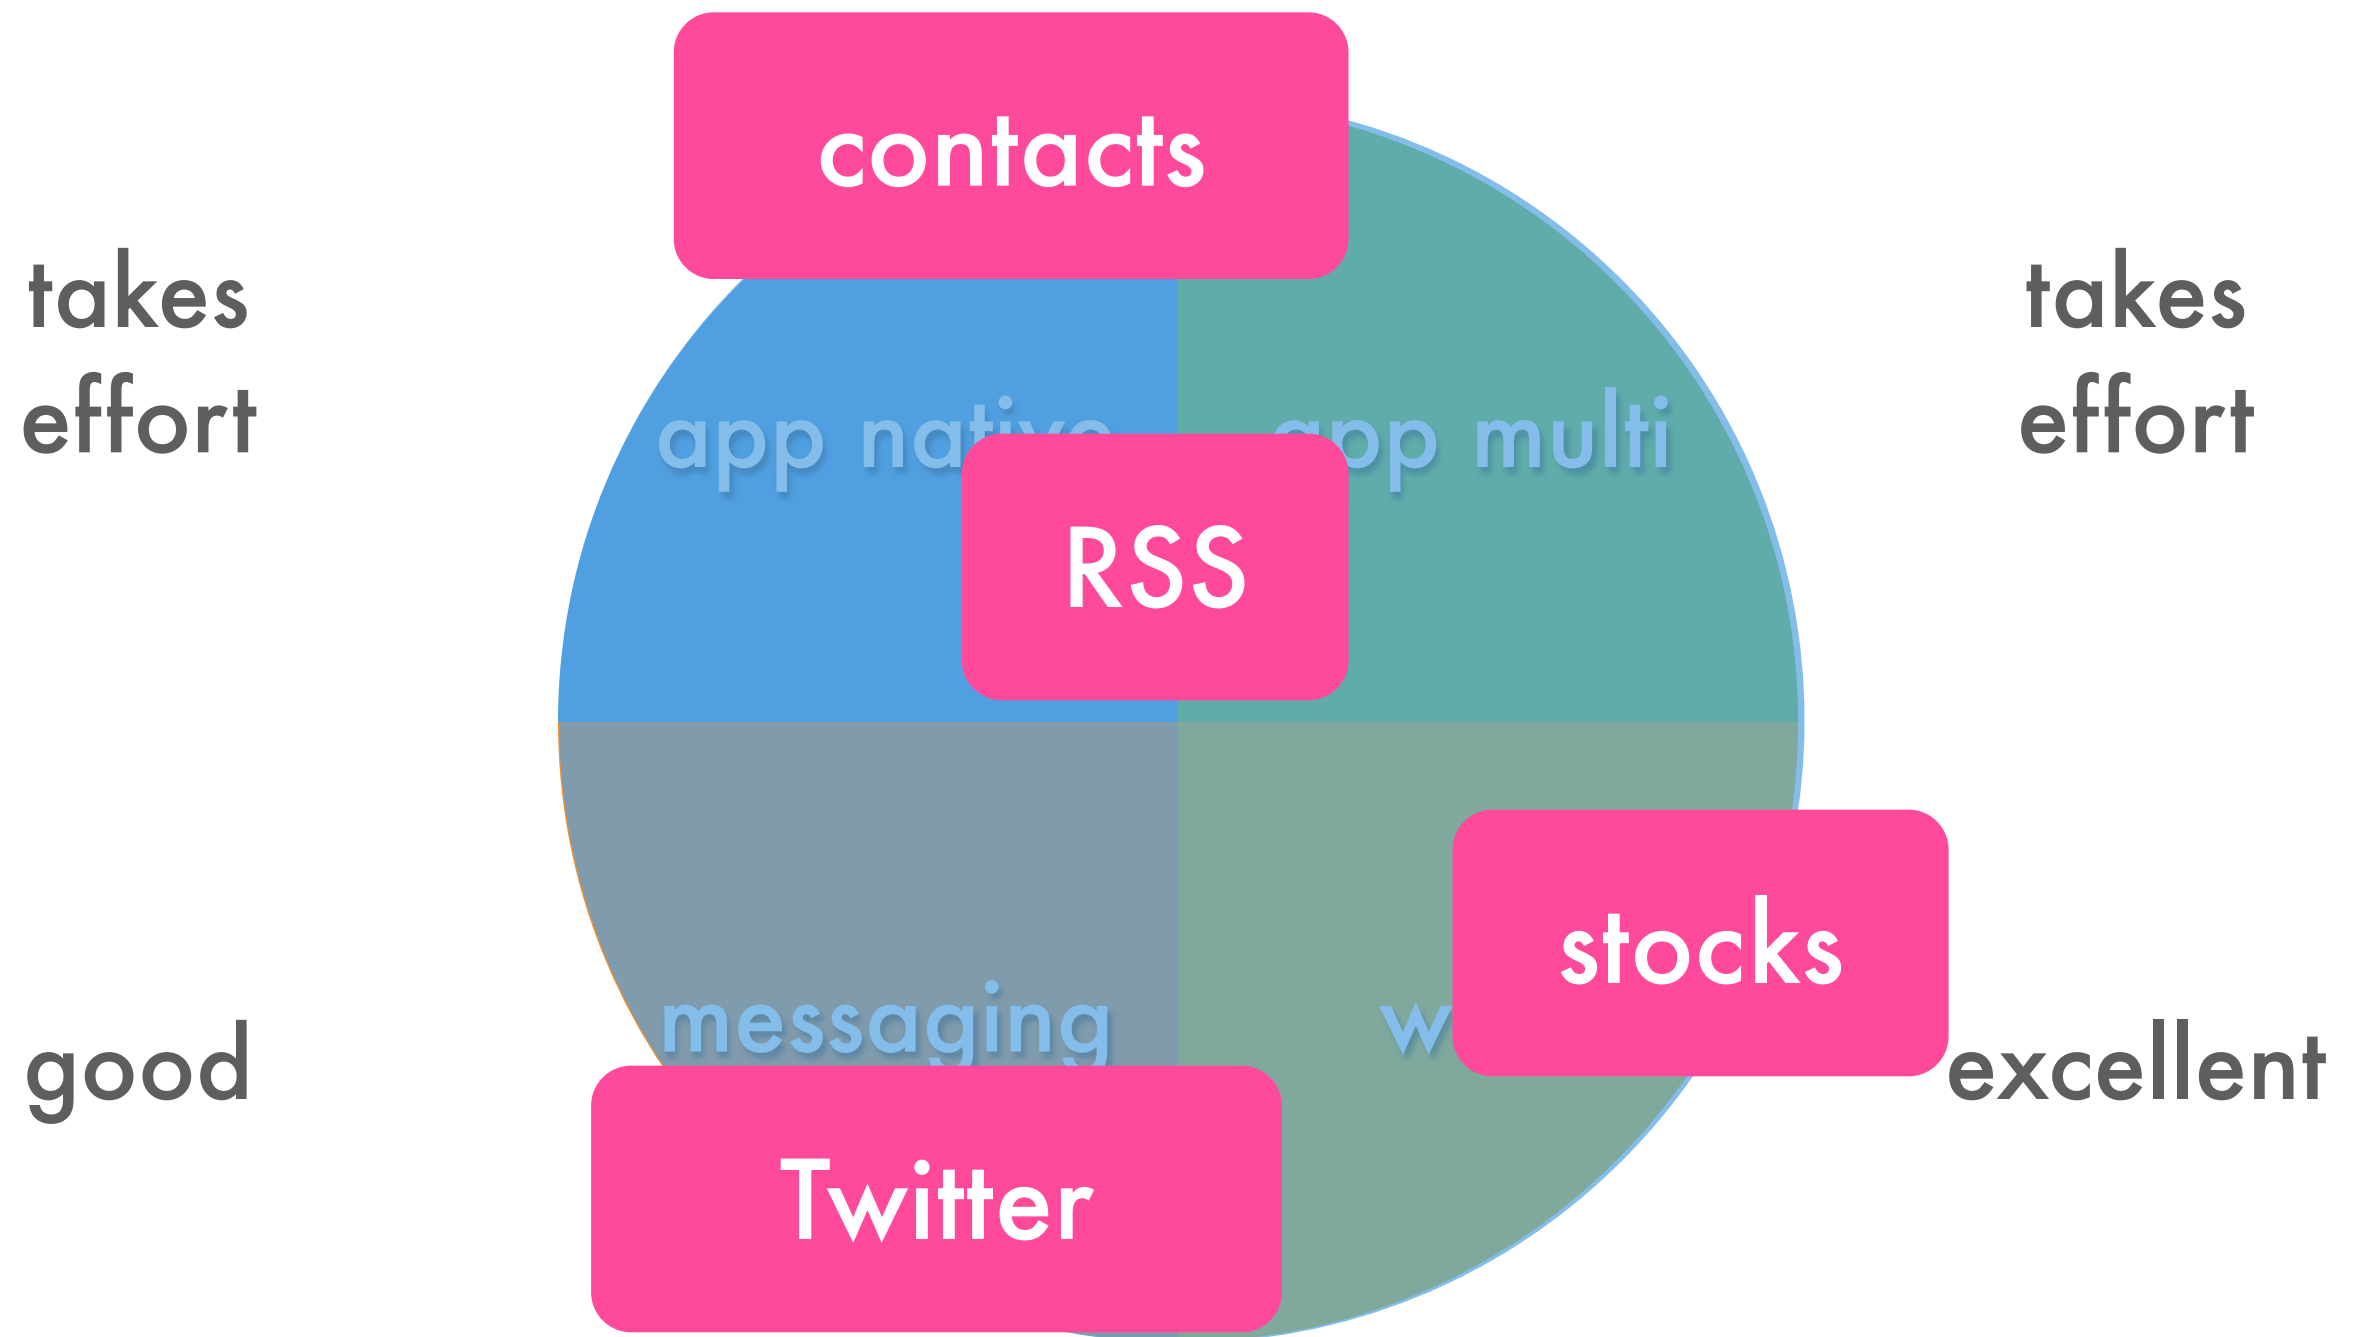

interaction flow

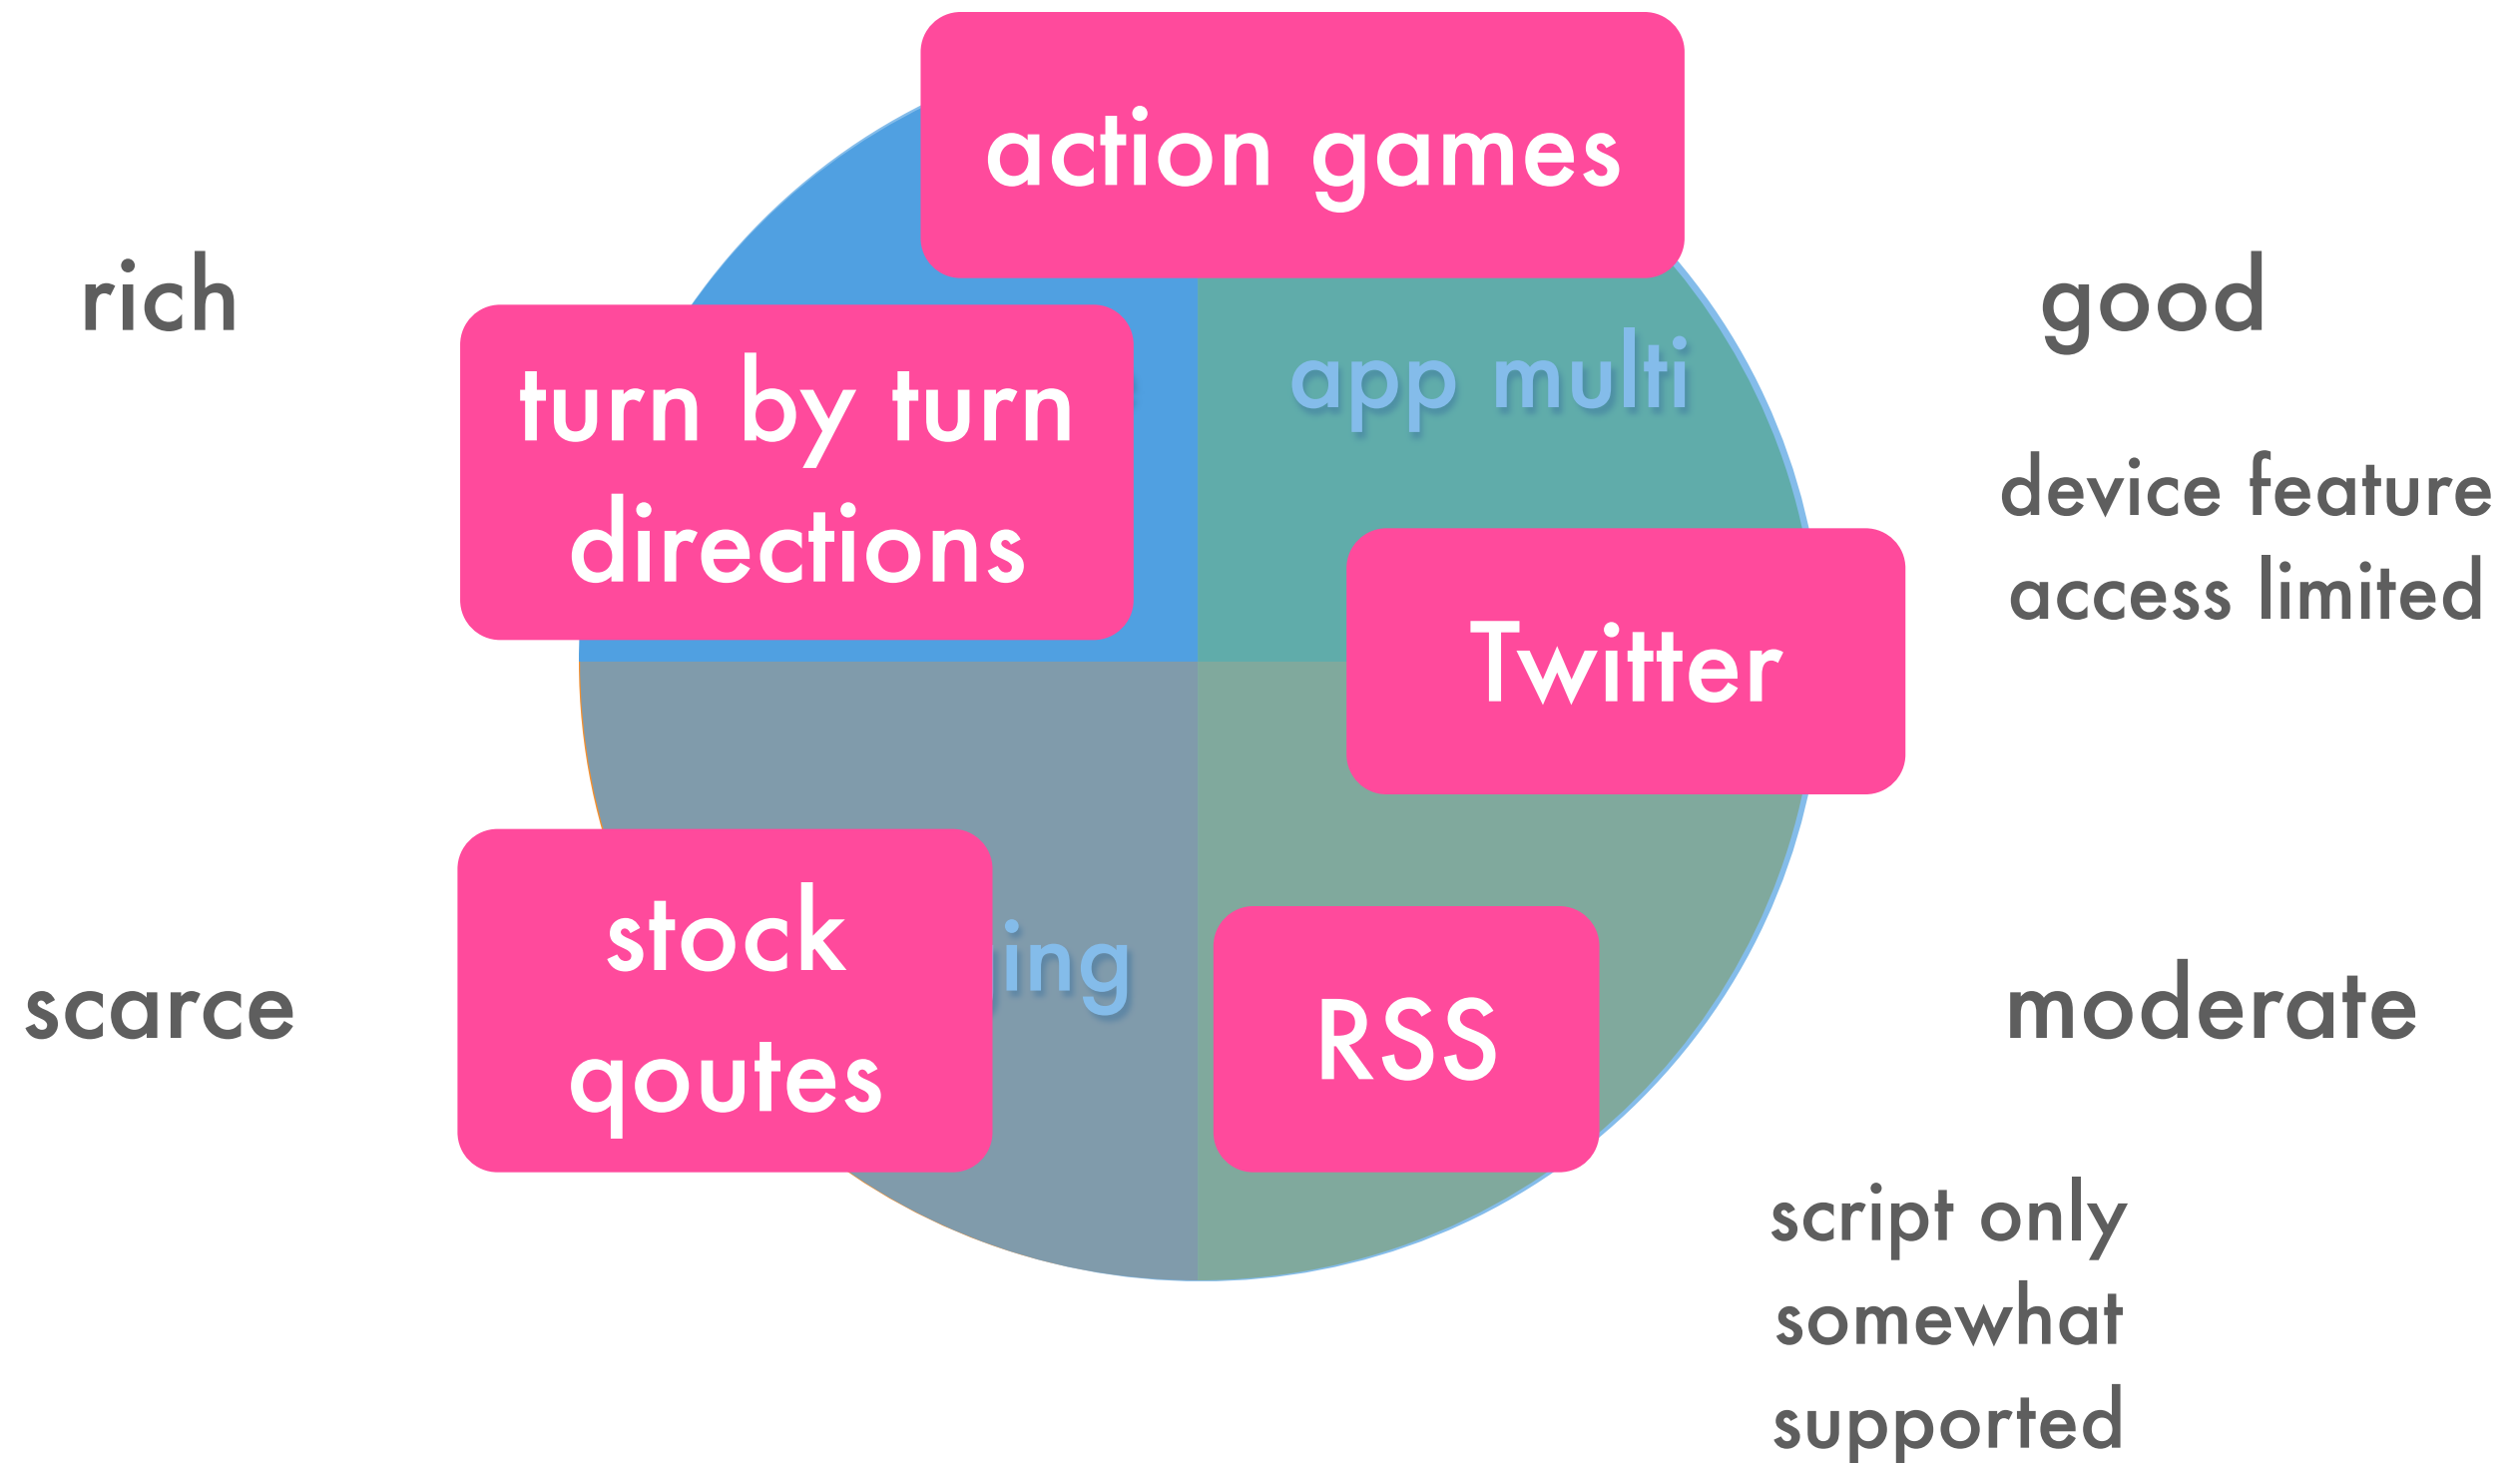

glanceability of data

- single screen paradigm makes difficult
- browser, app not likely running
 - less true for smart phones
- smart phone home screens
- future: widgets

freshness of data

interaction richness

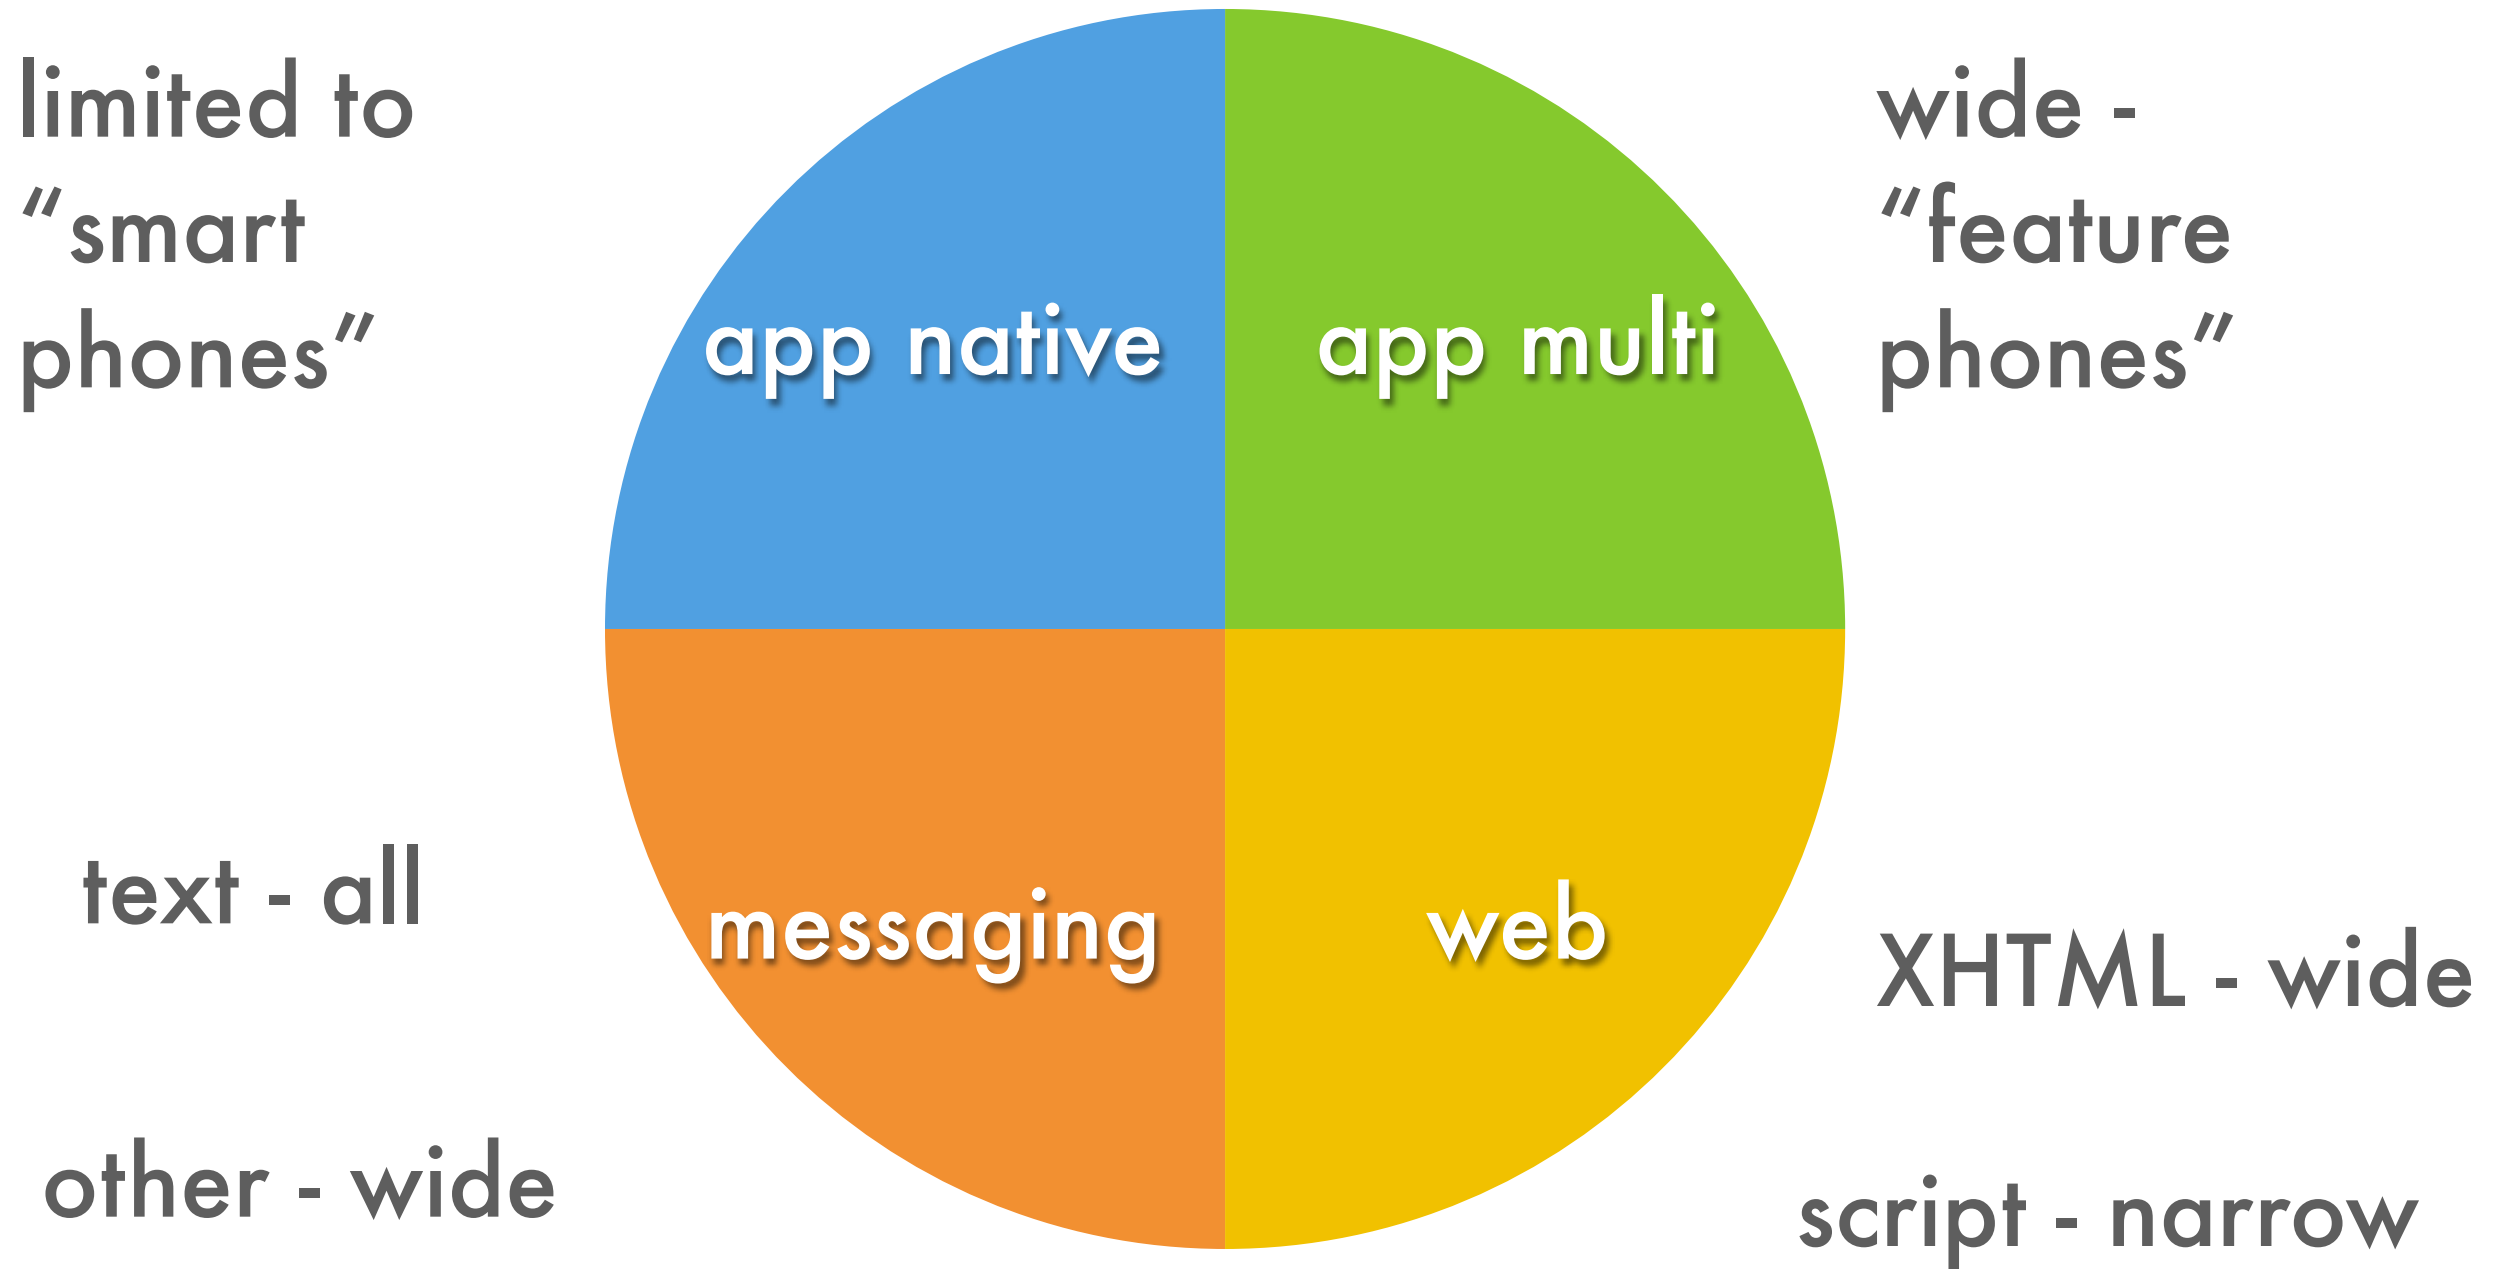

business needs

target market = devices

- Business users - mostly “smart phones”
 - North America: Windows Mobile, Blackberry
 - Europe: Symbian, some Windows
 - Asia: mix - Linux, ARM
- Consumers - mostly “feature phones”
 - Africa: Symbian, Windows
 - elsewhere: mix (Symbian uncommon in US, Asia)

impact of device selection

smart phone?

named OS?

download
native
apps?

heavy
data

distribution issues

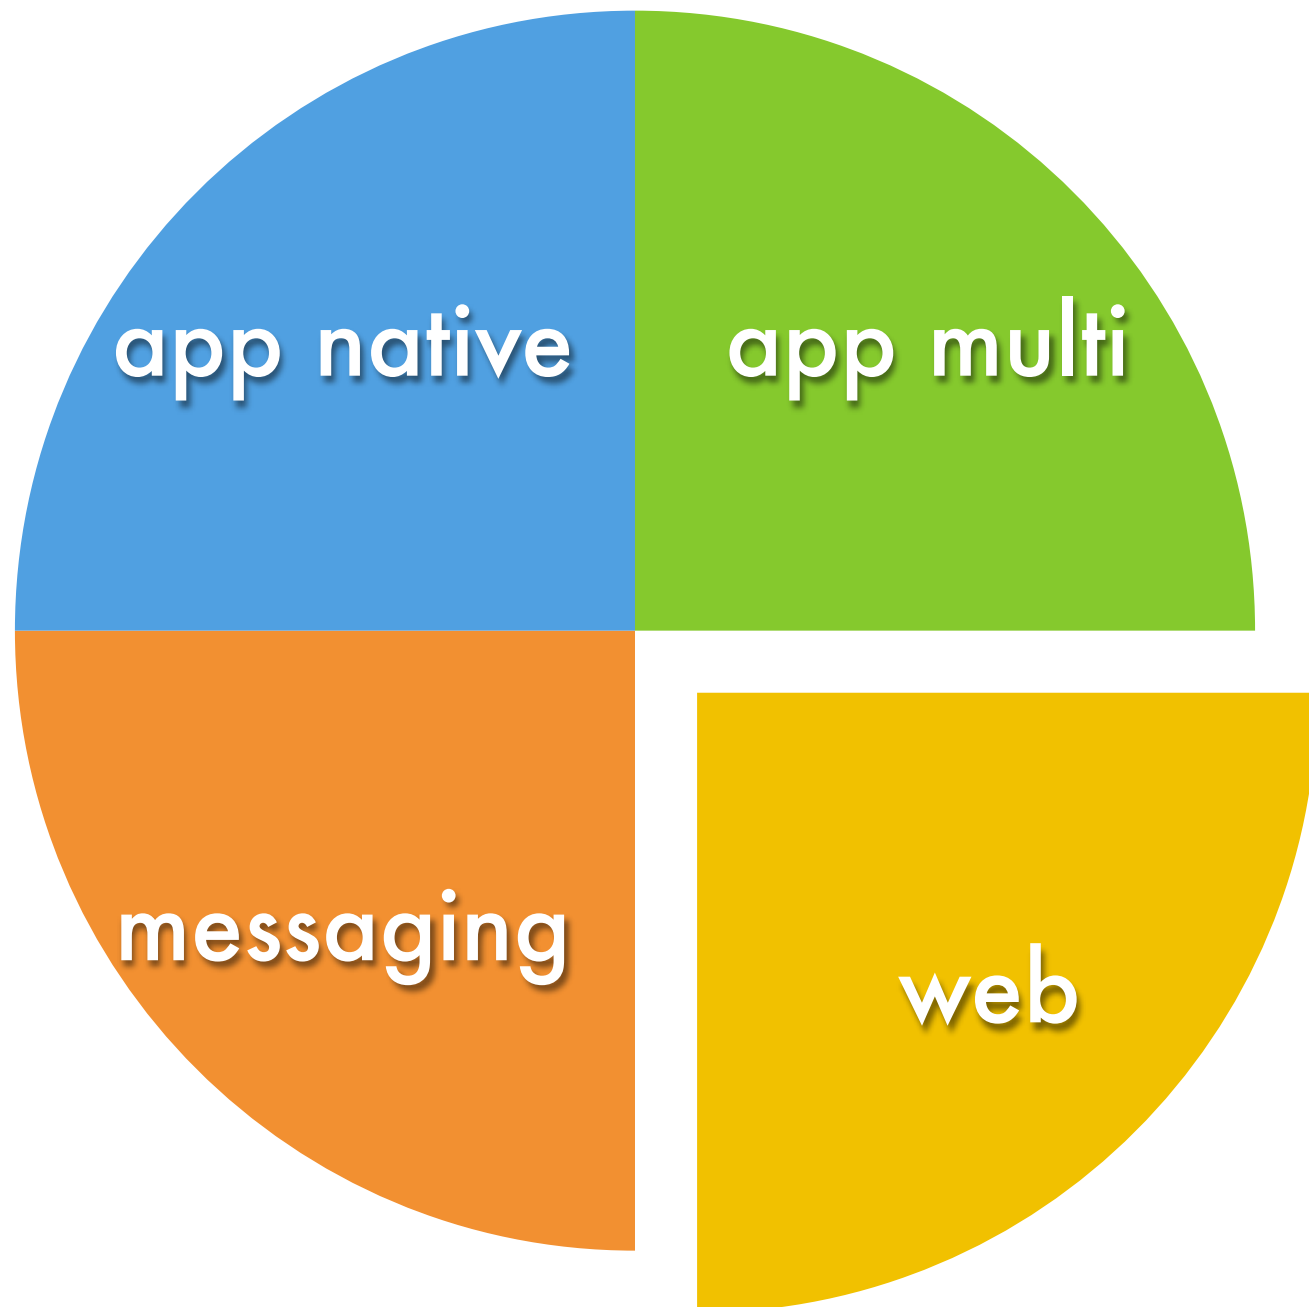

- carrier (“on deck”)
 - only way to distribute BREW
- off deck
 - may need carrier relationship anyhow
- SMS links
 - disabled by Verizon
- 3rd party sales (e.g., Handango)

discovery issues

- environmental (e.g., billboard)
 - camera input/MMS
 - short codes
 - messaging apps
 - downloadable apps (carriers may block)
 - URL
 - .mobi unnecessary (m.gmail.com)
- on deck

platform issues

web issues

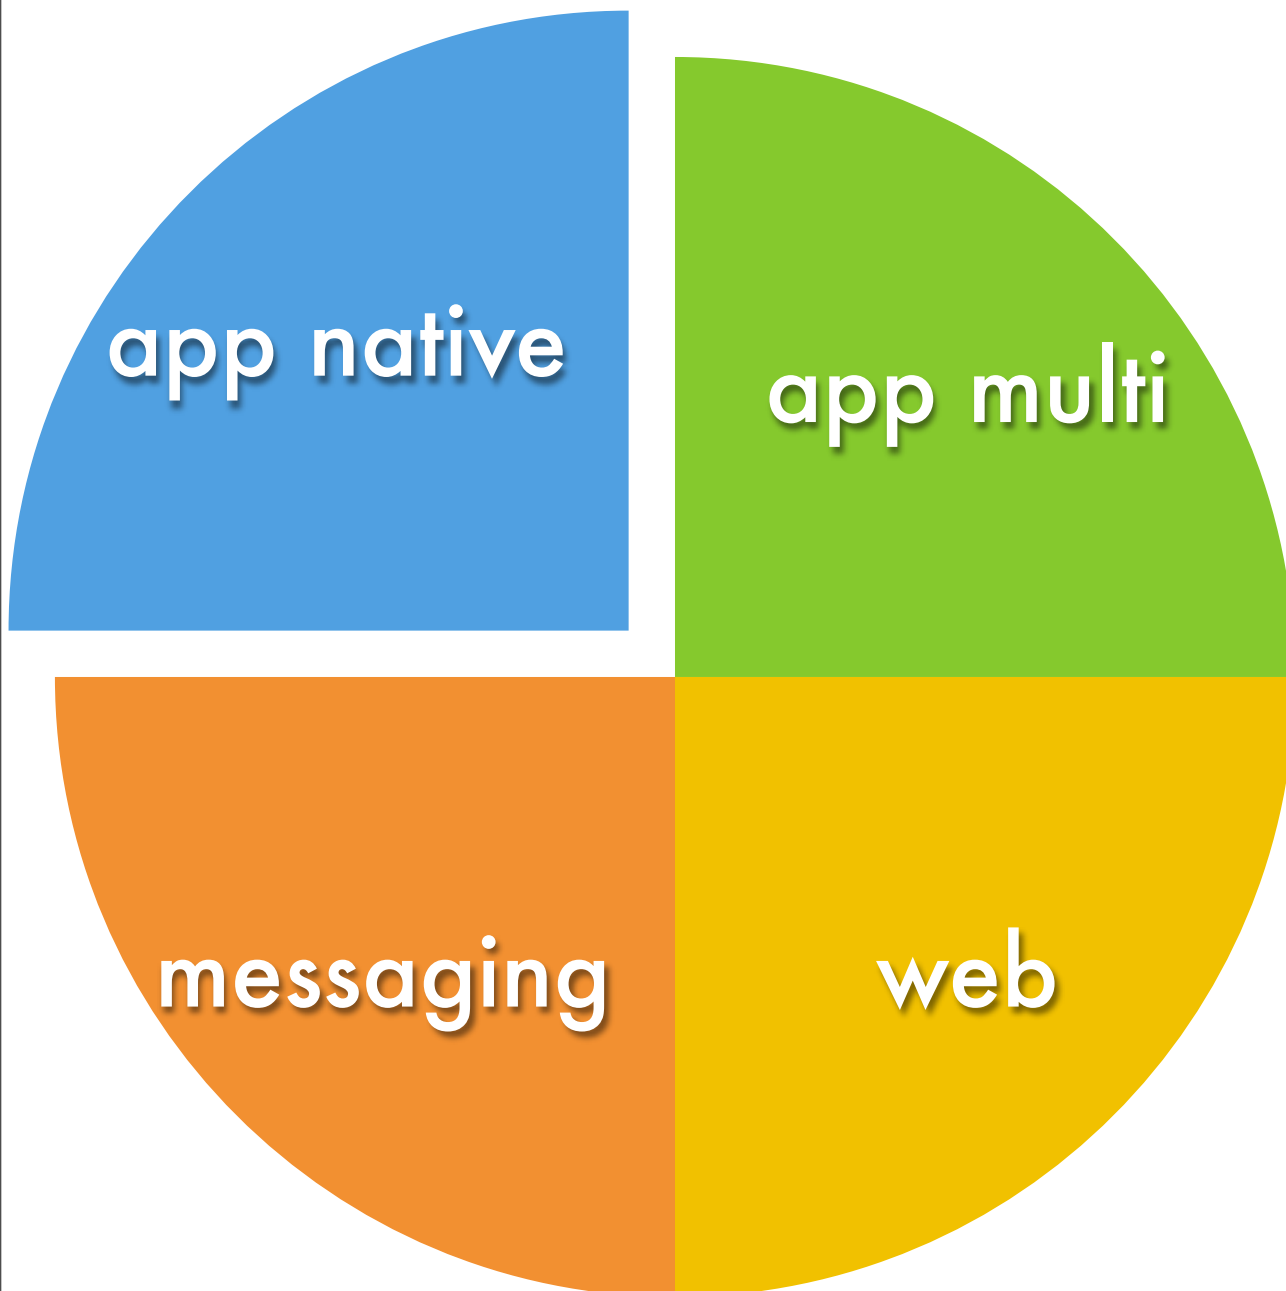

- limited script support
- variable standards
- Opera Mini vs. Mobile
- helper apps
- Flash Lite

messaging issues

- SMS ubiquitous
- no guaranteed delivery
- lag
- MMS rendering differences
- premium SMS costly

native app issues

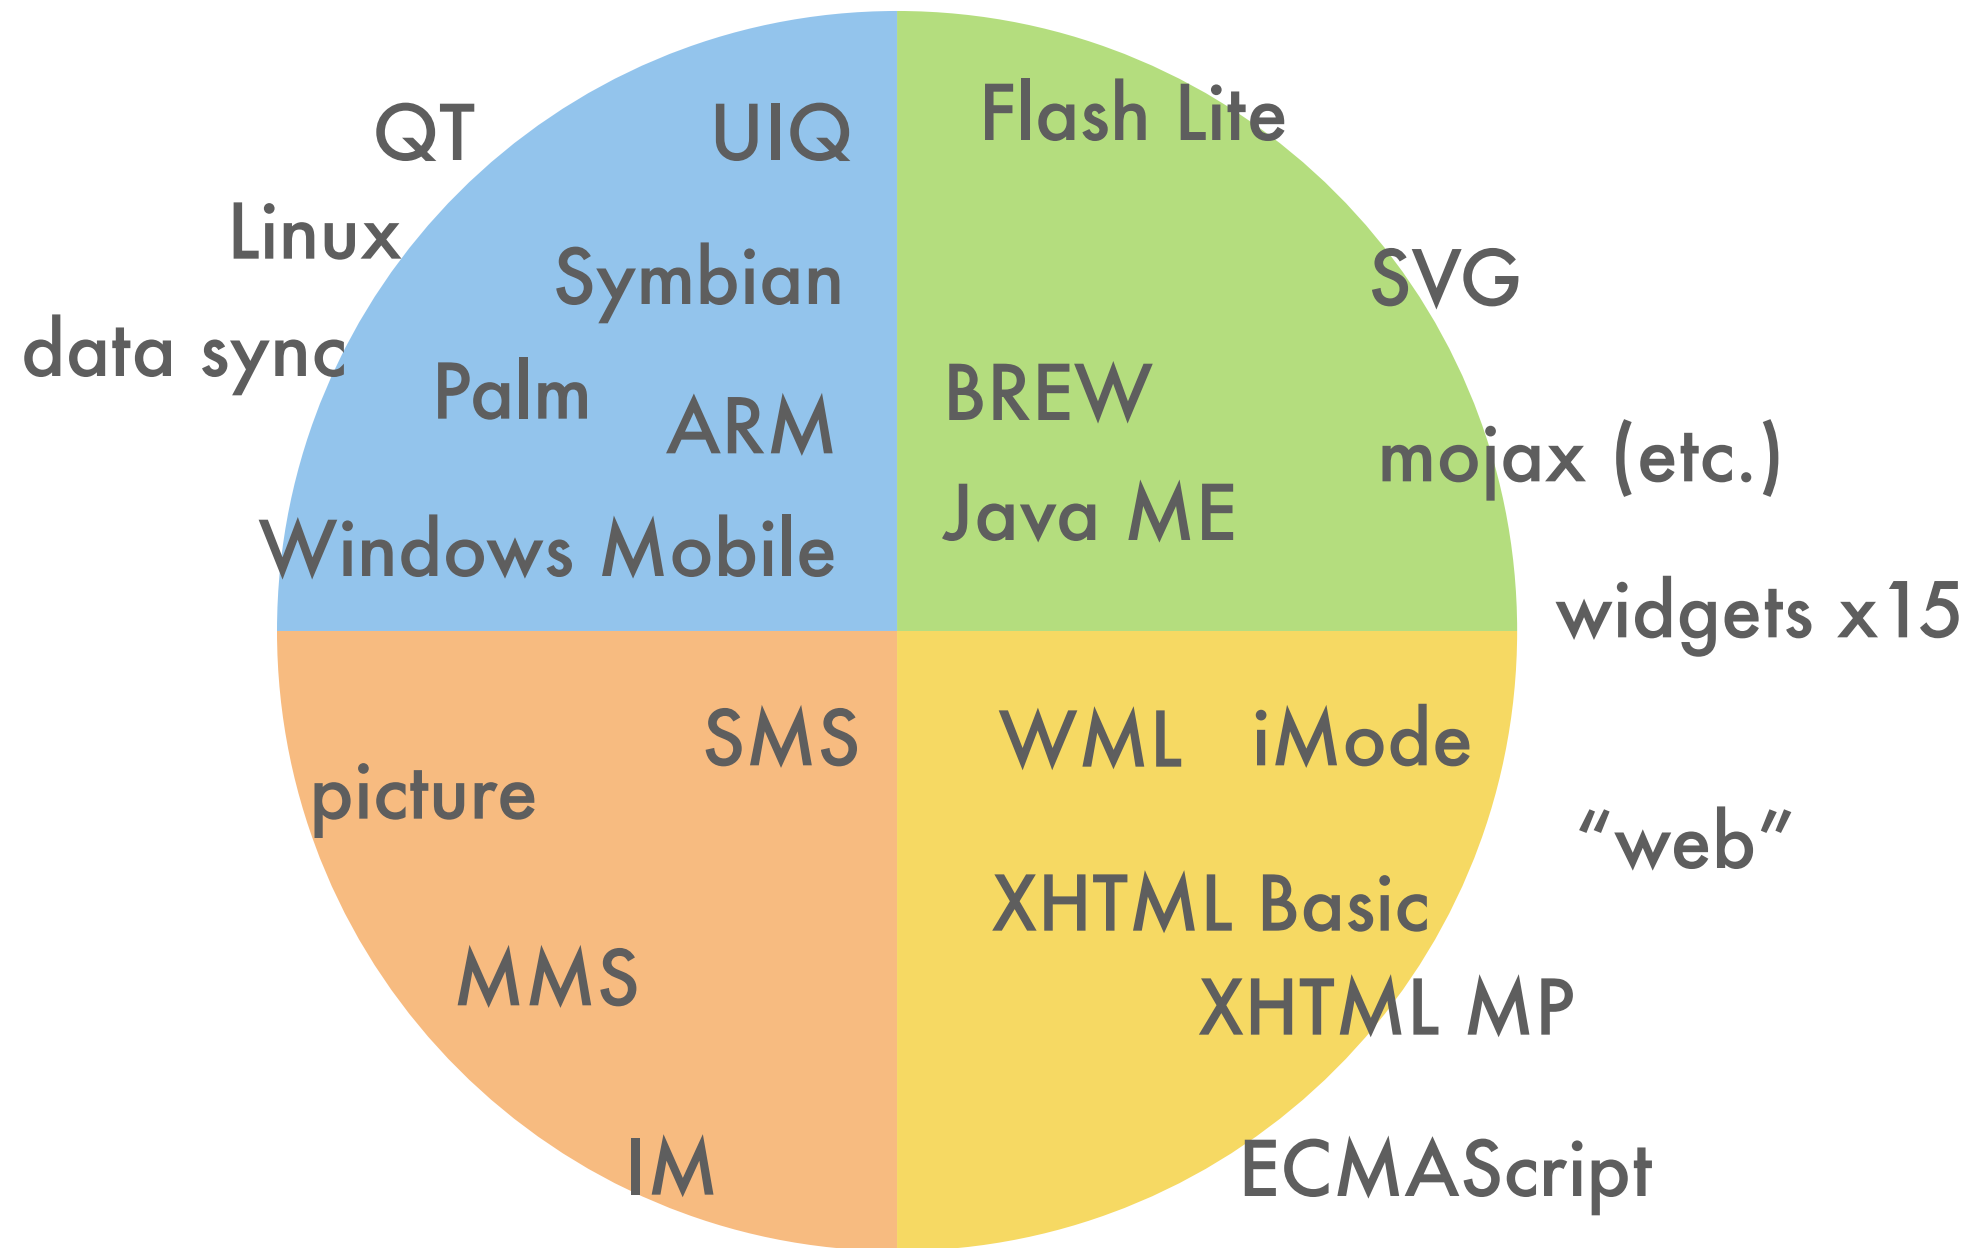

- expensive to maintain
- 6% market in US
- highest data use
- still rendering issues
- less supported by carriers

multi-device platform issues

- BREW via carrier only
- rendering issues
- device support varies
- launch times (esp. Java)
- testing & porting
