

Leveraging Cloud Computing

Types of Services

- Infrastructure Services
 - Servers, Storage, Communications , Connectivity
- Utility Services
 - Data Management, Development Tools, Development Services
- Functional Services
 - Software packages, Custom Solutions, Components

Potential Benefits

- Scale
- Agility (speed + flexibility)
- Reduced complexity
- Improved productivity

Potential Challenges

- Domain knowledge
- Transparency
- Reliability / SLAs (still evolving)
- Security & Compliance (still evolving)
- Extended Help Desk (Customer Service)

A Few Risks

- Virtualization for network, computing, and storage may not scale...
- Pay for services you may not need
- Vendor “lock-in”
- Lack of carrier-grade services for Tier 1 systems and/or their dependent systems
- Potential for single point of failure

Don't rely on instruments to fly ...

- Need to guide your investments carefully in this space. Best to experiment first and get a feel for the benefits, challenges, and risks.
- Price versus Value based decisions will yield very different outcomes as they are based on completely different models.

Shift Happens...

- Collaboration is where most organizations expand into virtual computing services. This is also where the challenge & adventure begins.
 - Cloud computing providers and solutions are a natural extension of collaboration.
 - Collaboration touches upon most areas of computing services and business services.
 - The 4 walls disappear so you need to rethink your computing & business architectures.

A Few Preparations ...

- Enterprise Architecture will come in handy
- Contingency Planning needs to be revisited
- Business Services need to be orchestrated, managed, and monitored in new ways
- Need to innovate the security model
- Abstraction will be a key measure of success

Let the Dialog Begin...

THE CLOUD COMPUTING ADOPTION MODEL
