Deliverables
BA deliverables are represented by points

Steps
Detailed steps are represented by lines connecting deliverables (in => out)

- Structure:**
- **Algorithm:**
 - 5 inputs, 3 outputs
 - several internal deliverables, connected through 13 steps,
 - grouped in 4 stages
 - **manual (230 pages) with examples**

For each deliverable the BA method gives:

- Description
- Examples
- Template

For each step the BA method gives:

- Inputs, Outputs
- Flow-chart, Explanation “how to do”
- Examples
- Validation criteria
- Skills and effort required
- Reference documents

List of BA deliverables

One difference from the Bizbok

@ Huawei we emphasize the collection of Value Streams into multi-dimensional blueprints that we call Business Operation Model (BOM)

Conceptually, from a metamodel perspective, the BOM can be regarded as a value stream.

Physically the BOM is an integrated set of value streams.
From this perspective it could be called “value network”.

We find this useful to clarify the whole business flow and we use it as a platform to build several views of the enterprise.

By overlay, we can map Processes, Organization, Information and other things depending on the case...

Here a simple *BOM* example...

...here some examples of overlay views

Biz. Operation Model (as-is / to-be)
