
Guild MM Meeting 1-24-18

Strategy Package:

- Much simpler
- Everyone should review
- Look for Strategy.png and compare to Strategy_1.png (simpler view)

Reference Class Elements in Foundations

- Class Element is the baseline object
- Capability Instance is an operating entity while it also inherits from a capability
- Note: Jim is working on the Operating Model team
- Inheritance from Capability is to clarify the capability concept

Capability Package

- Capability Concept is now introduced
- Composition relationship is only associated with Capability
- Previously capability outcome was restricting business object
- There are capabilities that affect other capabilities
- Capability Characteristic is a future discussions
- Notion in TOFAG that when you are creating an initiative, they use a staged process for delivering capability.
- Archimate & TOGAF realization of staging change in capabilities via capability increment
- Capability increment is the TOGAF version of change on the increment
-

Product Package:

- How do we represent a product as a service ?
- Product concept is now an operating entity to accommodate a service
- Abstract class used to clean up what is similar between product & product line
- Capability is realized from a product or service
- Product / service is similar to semantic issues we have seen before
- Should take up this discussion next week when Bill returns
- Concern with the placement of Capabilityversus focusing on value
- Team need to review and respond

Capability Instance

- TOGAF is mixing up 2 different aspects associated with staged changes
- Capability Instance needs to be further reviewed
- Team need to review and respond

Additional Notes:

- Capability should be kept at a functional description to ensure stability
- Need a structural concept for conveying behavioral aspect of capability - suggests temporal understanding that occurs after the fact
- Question: How do we bring in the concept of heat mapping ?
- Question: How do we introduce Assessment / Measurement ?
- Question: Does capability specification flow over into SMM ?

Actions Required:

- Team - Review the following packages and provide feedback / suggested changes
 - Product - mostly complete, but we're still noodling on how to address service using the notion of Capability association with Product Concept (which is new)
 - Strategy - completely reworked, greatly simplified (are we missing anything ?). Take a look at the lightweight introduction of Change (trying to avoid the slippery slope)
 - Capability Specification - this was just introduced to provide a way to incrementally introduce features for a Capability Instance (which has an operational perspective)
 - Stakeholder - 2 versions (one outlines a simple object model showing the various types of stakeholders, the other incorporates Value, Capability, & Initiative - part of the Information Package)

Next Week:

- Review feedback for the above 4 packages
- Review updated Requirements Package
- Regrets (Jeff will be offline - all day meeting)
