ASSOCIATIONS

✍ Association (direction: Unspecified) values

This is a high level association linking a value proposition to a product. If details are added to the business architecture, they must satisfy this association's constraint that the ValueItems added to the ValueProposition must value the Product or ProductLine.

Source: Public (Class) Product Concept

Target: Public (Class) Value Proposition

✍ Association (direction: Unspecified) relies on

Source: Public (Class) Product Concept

Target: Public (Class) ValueStream

✍ Association (direction: Unspecified) owns

This meta-model association represents the concept that a BusinessUnit owns (has responsibility for) a Product or a ProductLine.

Source: Public (Class) Business Unit

Target: Public (Class) Product Concept

✍ Association (direction: Unspecified) enables

This association is a high level abstraction of the "enables" associations of the BusinessObjects and/or InformationConcepts contained in the Product or ProductLine with the Capabilities that produce them. The associations is valuable for aggregating and presenting information about the performance of Capabilities that enable the components of a product. It can also be used when the detailed components of a Product or ProductLine are not yet modeled.

ASSOCIATIONS	
Source: Public (Class) Capability	Target: Public (Class) Product Concept
 Association (direction: Unspecified) relies on This association is a high level abstraction of the "enables" association between the ProductConcept and the Capabilities that "support" the ValueStreamStage. A ProductConcept relies on a ValueStreamStage when the ProductConcept contains ObjectConcepts that are enabled by Capabilities that support the ValueStreamStage	
Source: Public (Class) Value Stream Stage	Target: Public (Class) Product Concept

Product

Class in package 'Product'

A Product is the overall experience provided by the combination of goods and services to satisfy the customer needs. This meta-model class represents the concept of a product.

Product
Version 1.0 Phase 1.0 Proposed
Serge Behar created on 10/3/2017. Last modified 4/25/2018

OUTGOING STRUCTURAL RELATIONSHIPS	
 Aggregation from Product to Product Products may contain other products. Composed products are often called "bundles". This aggregation represents the non-exclusive containment of some Products by a bundled Product. Note that a bundle may be nothing more than a discount and it should not be taken to mean that the components of a bundle somehow rely on each other. [Name is bundles. Direction is 'Source -> Destination'.]	
 Aggregation from Product to Product Line [Direction is 'Source -> Destination'.]	
 Generalization from Product to Product Concept [Direction is 'Source -> Destination'.]	

INCOMING STRUCTURAL RELATIONSHIPS	
 Aggregation from Product to Product Products may contain other products. Composed products are often called "bundles". This aggregation represents the non-exclusive containment of some Products by a bundled Product. Note that a bundle may be nothing more than a discount and it should not be taken to mean that the components of a bundle somehow rely on each other. [Name is bundles. Direction is 'Source -> Destination'.]	

ASSOCIATIONS	
 Association (direction: Unspecified) generalizes This association should be interpreted in model instances as asserting that every statement that is true about the more general Product is also true about the more specific Product.	

ASSOCIATIONS	
Source: Public (Class) Product	Target: Public (Class) Product
 Association (direction: Unspecified) is similar to Product may be similar to each other.	
Source: Public (Class) Product	Target: Public (Class) Product
 Association (direction: Unspecified) is complementary to Product may be seen to be complementary to each other.	
Source: Public (Class) Product	Target: Public (Class) Product

 Association (direction: Unspecified) is complementary to Product may be seen to be complementary to each other.	
Source: Public (Class) Product	Target: Public (Class) Product

Product Line

Class in package 'Product'

A "product line" is defined as a series of different products which form a group, all made by the same company or its business partners.

The ProductLine concept is used to group a family of products together in a meaningful way. A product line may be based on common traits (e.g. life insurance), a targeted buyer (e.g. commercial product line).

A ProductLine should define the rule used to group the products together.

Product Line

Version 1.0 Phase 1.0 Proposed

Serge Behar created on 10/3/2017. Last modified 4/25/2018

OUTGOING STRUCTURAL RELATIONSHIPS

OUTGOING STRUCTURAL RELATIONSHIPS

← Generalization from Product Line to Product Concept

[Direction is 'Source -> Destination'.]

INCOMING STRUCTURAL RELATIONSHIPS

⇒ Aggregation from Product to Product Line

[Direction is 'Source -> Destination'.]

ASSOCIATIONS

✍ Association (direction: Unspecified) generalizes

Model instances of this association should be interpreted as asserting that every statement that is true of the more general ProductLine is also true of the more specific ProductLine.

Source: Public (Class) Product Line

Target: Public (Class) Product Line

✍ Association (direction: Unspecified) generalizes

Model instances of this association should be interpreted as asserting that every statement that is true of the more general ProductLine is also true of the more specific ProductLine.

Source: Public (Class) Product Line

Target: Public (Class) Product Line

ISSUES

✖ New, Medium. ProductLine grouping rule makes Product similarity associations redundant

Raised on: 2/28/2018

ProductLine should define the rule used to group products together. Product has similarity associations "is complementary to" and "is similar to". The first of these associations indicates that products could be bundled, but are not. This association should probably be derived from analysis and not explicit in the model. The second association asserts the potential for grouping the products into a product line. It should also be as association derived from an analysis and not explicit in the meta-model.

[Reported by Jim Rhyne. Version 18028C720AISS.]

ObjectiveConcept

Class in package 'Strategy'

CapabilityBehavior

Class in package 'Capability'

The CapabilityBehavior class represents behavior specifications such as procedures, process definitions, policies and norms. It models the "how" associated with Capability.

The behaviors represented by CapabilityBehavior can be either real or planned.

Capabilities and CapabilityInstances can have behaviors that are represented by CapabilityBehaviors.

CapabilityBehavior
Version 1.0 Phase 1.0 Proposed
Jim Rhyne created on 10/11/2017. Last modified 4/25/2018

Target: Public (Class) CapabilityBehavior

ISSUES

 New, Low. Consider relabeling to CapabilityBehavior

Raised on: 2/26/2018

CapabilityBehavior more clearly expresses the concept this class intends to represent.

[Reported by Jim Rhyne. Version 1803B22CC6ISS.]

Characterizes

Class in package 'Capability'

The "Characterizes" class is the core element in a binary association pattern linking CapabilityConcept and CapabilityCharacteristic. This linkage represents the association of a behavior to either a Capability or a CapabilityInstance. A CapabilityCharacteristic would be associated with a Capability during strategic planning to define an intended new behavior for the Capability. During Initiative planning, the CapabilityCharacteristic would be associated with a CapabilityInstance that defines the resources expected to be needed by the CapabilityInstance when implemented. Open Issue:

The concept represented by this association is not simple. In practice, the skills identified in the resources of the CapabilityInstance would need to be linked to the roles specified in the behavior descriptions of the CapabilityCharacteristic.

Value Stream Stage

Class in package 'Value'

A distinct, Identifiable phase or step within a value stream that has a unique name, entrance criteria, exit criteria, and identifiable participating stakeholders(s). (BIZBOK 6.5)

A distinct, identifiable phase or step within a ValueStream that produces some ValueItems.

For example, each value stream stage creates value for one or more stakeholders as it moves from left to right. While one can argue that a value stream to authorize a driver's license for an applicant is most valuable at the end state, consider that there is value in allowing the application to pass the vision exam. The applicant is informed that he or she has the visual ability to get a license and has additionally learned that his or her vision is not impaired. (BIZBOK p 140)

Value stream stages are owned by a value stream or a value stream stage and are not shared. It will often be the case that capabilities will support several value streams. The trade audit capability in a bank supports both the bank customer's value stream and the bank shareholder's value stream by reducing mistakes and fraud. The business architect must model this situation by sharing capabilities between value stream stages.

Because capabilities are often associated with significant business objects or concepts and represent compositions of more detailed capabilities, it is possible that the same capability may support several stages in a value stream. For example, a case management capability in an insurance business may support multiple value stream stages in the claims processing value stream. This usually occurs when the capability has not been decomposed into sub-capabilities to represent the different activities that occur in different value stream stages. Consequently, when a capability "supports" a value stream stage it is implied that at least one sub-capability of that capability also supports the value stream stage.

NOTE: an instance of ValueStreamStage cannot be simultaneously parented by both a ValueStream and another ValueStreamStage.

INCOMING STRUCTURAL RELATIONSHIPS

⇒ Aggregation from Value Stream Stage to Value Stream Stage

This association decomposes a value stream stage into an ordered sequence of value stream stages.

[Name is composed of. Direction is 'Source -> Destination'.]

ASSOCIATIONS

 Association (direction: Unspecified) has exit condition of

An exit condition is a condition that must be achieved in order for the ValueStreamStage to have finished its work. The exit condition is fulfilled by an Outcome of some Capability that supports the ValueStreamStage. This association represents the linkage between the Outcome and the ValueStreamStage whose exit condition the Outcome satisfies.

Source: Public (Class) Value Stream Stage

Target: Public (Class) Outcome

 Association (direction: Source -> Destination) has exit condition of

Source: Public (Class) Value Stream Stage

Target: Public (Class) Produce

 Association (direction: Unspecified) has entry condition of

An entry condition is a condition that must hold in order for the work of a ValueStreamStage to begin. Such a condition must be satisfied by an Outcome from a Capability that supports a preceding ValueStreamStage in the same ValueStream.

In the capability map, a Capability may need an Outcome (e.g. the availability of a part to configure into an assembly) that is produced by another Capability (e.g. Inventory Management). The meta-model defines the Outcome satisfying the entry condition as an Outcome needed by a Capability that enables the ValueStreamStage. This definition of the association between an entry condition and an Outcome simplifies the meta-model, compared with the initial definition, because it avoids a reference to a preceding ValueStreamStage in order to select the Capability that produces the Outcome.

This association is a high level association intended to be used in value/capability cross mapping when the capability map may

ASSOCIATIONS	
not be complete. It is also used to simplify presentations intended to create understanding and drive decision making.	
Source: Public (Class) Value Stream Stage	Target: Public (Class) Outcome
 Association (direction: Unspecified) relies on This association is a high level abstraction of the "enables" association between the ProductConcept and the Capabilities that "support" the ValueStreamStage.  Association (direction: Unspecified) impacts	
Source: Public (Class) Initiative	Target: Public (Class) Value Stream Stage

ValueStream

Class in package 'Value'

An end-to-end collection of activities that create a result for a customer, who may be the ultimate customer or an internal end-user of the value stream. (Source: Ralph Whittle and Conrad Myrick, *Enterprise Business Architecture: The Formal Link between Strategy and Results* (Boca Raton: Auerbach, 2005).

A value stream has one clear goal, to satisfy or to delight the customer. (Martin 1995)

Value streams strive to achieve the triggering stakeholder's value proposition as stated in the name of the value stream. (BIZBOK p 138)

A value stream is associated with ("delivers") some value propositions, one for each customer segment that is taken to be a stakeholder for the value stream.

Value streams may be decomposed into ordered sequences of value stream stages, and value stream stages may also be decomposed into ordered sequences of stages. This allows the architect to control the complexity of value stream diagrams. The meta-model does not limit the levels of decomposition, but good practice is that decomposition of value

streams should be limited to 2 levels. Note that a value stream stage is not a value stream and is not associated with a triggering stakeholder or a value proposition. Note also that a value stream is not supported by capabilities.

ValueStream
Version 1.0 Phase 1.0 Proposed
jrhyne created on 5/18/2015. Last modified 4/25/2018

OUTGOING STRUCTURAL RELATIONSHIPS

ASSOCIATIONS

 Association (direction: Unspecified) delivers

Source: Public (Class) ValueStream

Target: Public (Class) Value Proposition

 Association (direction: Unspecified) triggers

The "triggers" association links a stakeholder to the ValueStream that is triggered by the stakeholder. A stakeholder may trigger the value stream directly (e.g. by asking to purchase an item) or indirectly (e.g. as in a loan default, where the triggering stakeholder establishes a rule or policy for triggering the value stream). The latter situation is called "triggering by proxy" in the BIZBOK.

Information Concept

Class in package 'Information'

InformationConcept is an abstract parent for the three concrete information classes that are used to model information types, information individuals and information relationships. It provides associations that are common to all three concrete subclasses:

- that a BusinessObject may make an InformationConcept explicit (tangible);
- The an InformationConcept is about a BusinessElement;
- That InformationConcepts may be linked by an InformationRelation.

ISSUES

✖ New, Medium. Relationship between Stakeholder and Organization::Executive

Raised on: 2/28/2018

Stakeholder is the abstract base class for both participating stakeholder and market segment.

Participating stakeholder - an internal or external individual or organization with a vested interest in achieving value through a particular outcome.

Executive is a concrete subclass of BusinessSocialGroup with the ability to monitor business performance and control behaviors of workers.

Is it plausible to assert that all Executives are ParticipatingStakeholders?

Source: Public (Class) BAMM Element	Target: Public (Class) Requirement
 Association (direction: Unspecified) source of	
Source: Public (Class) Requirement	Target: Public (Class) BAMM Element

Requirement

Class in package 'Requirements'

Scope:

Focused on a specification only as it pertains to directing changes to a Product, an Object, AND enabling a Capability.

Core Touch points:

- Requirements - requirements aggregate (up & down) into requirements (at various levels of granularity and type)
- Capability - requirements link to Capability Behavior since we are specifying "how" a capability will get delivered
- Product - requirement evolves the Product at a conceptual level, which is reflected in one or more Product Instances. Requirements will specify how a product will change via changes to it's design
- Object Concept - In almost every case, information is touched when changes are made, so it's important to influence include both Information Concept & Business Object
- Information - Requirement is framed by the business glossary, which are the terms used to guide the information architecture. Information establishes the scope and categorization for requirements. We are linking at the Information Concept to address the above alignment.
- Stakeholder - requirement delivers value to the stakeholder, while creating clarity tailored to each stakeholder perspective
- Value Stream & Value Stage - Value Stream clarifies how value should be delivered by a requirement. Whereas Value Stage provides the boundary for what is included in a requirement. Value Stream also enables reuse of requirements across initiatives (projects). Value Stream also provides context for requirement.
- Strategy - As strategy is somewhat amorphous, we link to the strategy concept to simplify the alignment and to ensure requirement aligns with the strategic outcomes
- Initiative - Typically referred to as a project (but not limited to a project) defines the scope, objectives, and measures for success to guide the requirements used to specify the design for a solution (waterfall or agile).

Other considerations:

We may want to discuss alignment (via Proxy) to other Meta Models as Requirements will be influenced by one or more of the following:

- Requirement MM from IEEE
- Change Management MM from (TBD)
- Business Rules MM from ?
- Structured Metrics MM (SMM)
- Business Motivation Model (BMM)

← Generalization from Requirement to Class Element

[Direction is 'Source -> Destination'.]

← Generalization from Requirement to CapabilityBehavior

[Direction is 'Source -> Destination'.]

← Aggregation from Requirement to Requirement

BIZBOK Reference:

Per Section: BA and Requirements Alignment in Practice

Requirement > aggregates > Requirement

[Name is aggregates. Direction is 'Source -> Destination'.]

OUTGOING STRUCTURAL RELATIONSHIPS

⇐ Generalization from Requirement to Requirement Rationale

[Direction is 'Source -> Destination'.]

⇐ Generalization from Requirement to Initiative

BIZBOK Reference:**Per Section: Why Requirements Alignment**

Initiative (Project) > supported by > requirement

Per Section: BA and Requirements Alignment

Requirement > links to > initiative

Per Section: BA and Requirements Alignment in Practice

Requirement > links to > Initiative (project scope)

[Name is supported by. Direction is 'Source -> Destination'.]

⇐ Generalization from Requirement to Realizes

[Direction is 'Source -> Destination'.]

INCOMING STRUCTURAL RELATIONSHIPS

⇒ Generalization from Value Stream Stage to Requirement

BIZBOK Reference:**Per Section: Principle of BA and Requirements Alignment**

Requirements > bounded by > Value Stream Stage

[Name is bounds. Direction is 'Source -> Destination'.]

⇒ Generalization from Affects to Requirement

[Direction is 'Source -> Destination'.]

⇒ Generalization from Information Concept to Requirement

BIZBOK Reference:**Per Section: Benefits of BA and Requirements Alignment**

information > establishes scope for > requirement

Information > improves categorization of > requirements

Per Section: Requirements Alignment with Information

Requirement > links to > Information (Concepts)

[Name is improves categorization of. Direction is 'Source -> Destination'.]

INCOMING STRUCTURAL RELATIONSHIPS

⇒ Generalization from ValueStream to Requirement

BIZBOK Reference:

Per Section: Benefits of BA and Requirements Alignment

Value stream > establishes scope for > requirement

Value Stream > clarifies how value is delivered by > requirement

Value streams > frame the context for > requirements

Value stream > enables reuse of > requirements

Per Section: Requirements Alignment with Value Stream

Requirement > is contextualized by > Value Stream

Per Section: BA and Requirements Alignment in Practice

Requirement > links to > Value Stream

[Name is establishes scope for. Direction is 'Source -> Destination'.]

⇒ Aggregation from Requirement to Requirement

BIZBOK Reference:

Per Section: BA and Requirements Alignment in Practice

Requirement > aggregates > Requirement

[Name is aggregates. Direction is 'Source -> Destination'.]

⇒ Generalization from Value Proposition to Requirement

BIZBOK Reference:

Per Section: Benefits of BA and Requirements Alignment

Requirement > links to > Business (Value) Proposition

[Name is guides. Direction is 'Source -> Destination'.]

ASSOCIATIONS

 Association (direction: Unspecified) source of

Source: Public (Class) Requirement

Target: Public (Class) BMM Element

 Association (direction: Unspecified) implements

Source: Public (Class) BMM Element

Target: Public (Class) Requirement

 Association (direction: Unspecified)

BIZBOK Reference:

Per Section: Requirements Alignment with Products

Requirement > links to > Strategy (strategic outcomes)

Per Section: BA and Requirements Alignment in Practice

Requirement > links to > Strategy

Source: Public (Class) ObjectiveConcept

Target: Public (Class) Requirement

Requirement Rationale

Class in package 'Requirements'

Requirement Rationale
Version 1.0 Phase 1.0 Proposed
Jeff Wallk created on 4/4/2018. Last modified 4/25/2018

INCOMING STRUCTURAL RELATIONSHIPS	
⇒ Generalization from ObjectiveConcept to Requirement Rationale	[Direction is 'Source -> Destination'.]
⇒ Generalization from Requirement to Requirement Rationale	[Direction is 'Source -> Destination'.]
