

CourseOfAction is a base class for both ActionPlan (Strategy) and Initiative (Initiative). CourseOfAction results in Objectives and may require Objectives, creating an enablement chain that shows the dependencies of each CourseOfAction

Additionally, a Rationale may be provided that explains why the Objective is expected or why it may be required by the CourseOfAction.

ActionPlan specializes CourseOfAction and several ActionPlans are aggregated to define the Strategy. Strategy defines some Outcomes as the desired Objectives of the Strategy

The contents of a Strategy are to be found by collecting the Objectives and resultsIn and requiredBy associations and strategyObjective associations and the associated Rationales for all ActionPlans aggregated by the Strategy.

Note that individual ActionPlans can be shared by Strategies. As a consequence of the composition rule in the previous paragraph, Objectives and specified associations can also be shared by different strategies.

The Capability Map is generic to a type of business and is not changed by a Strategy unless the strategy is to change the type of business (this case is not defined yet in the meta-model). The more common case is that the Strategy effects changes in one or more CapabilityImplementations.

The current meta-model makes no commitment about whether Objectives can be shared by different CourseOfAction instances. It is reasonable to think that several CourseOfActions can result in the identical Objective.
