

Giovanni

Jeffrey and all,

as timezone difference will make it too hard for me to attend let me email some thoughts about scenarios.

One concern I have on the current list of scenarios (column B of the table): I see a mix of entries, some being general, some looking rather specific instances of certain scenarios, some just expressing specific expected benefits of BA.

In my understanding of the metamodel spirit we should make an effort to define a comprehensive list of general scenarios, or scenario types, while instances can be used as examples.

The relevant chapter of the Bizbok also remarks that its list of “scenarios” should not be considered exhaustive of BA application.

In other words I suggest that column A could still be called “scenarios types” while column B should be called “scenario instances” or “examples” for clarity, so that nobody will expect column B entries to be an exhaustive list of BA applications.

Coming to column A: it should be the reference for the sake of metamodel adoption. It should aggregate under the same scenario type all those cases where BA “work” is not macroscopically different.

E.g. “Merger and Acquisition Analysis”, “Joint Venture Development” and “Business Capability Outsourcing” will probably require similar assessment of capabilities to determine overlaps and enhancements in the light of a certain strategy... so they could be listed as different scenario instances of the same scenario type from the point of view of metamodel application.

As a consequence, scenario types should tend to be orthogonal with each other or at least one scenario type should not overlap completely with another scenario type.

Therefore, certain entries in column A should be reviewed: for example “Stakeholder Alignment” is hopefully an effect that any BA application scenario should achieve rather

than an independent scenario type. Same said for “Consistent Understanding”.

Generalized scenario types I suggest to consider in column A:

Impact and risk analysis to support strategy formulation

Strategy decoding for new business or new business model implementation

Strategy decoding for organic growth within an existing business model

Strategy decoding for inorganic growth within an existing business model

Operational excellence and continuous improvement

Organization structural change

Support to initiative management

Regards

giovanni
