

Requirements Management

- **Agenda:**
 - Big Picture
 - Current State
 - Future State
 - Transition from Project Artifacts to Operational Guidance
 - SIPOC for Business Analysis (BA)

Note: Customer Needs is a separate discipline that needs to marry up to requirements management. This is a much larger topic and one that is not well understood (let alone put in practice).

A separate deck would need to be devoted to outlining this discipline along with the data-driven approach for capturing this information and aligning it with business and domain models.

Big Picture

Note: The MDR (metadata repository) contains the taxonomies and ontologies for which all requirements must adhere (semantic mappings support all POVs)

Current State

•3

- **Today requirements are :**
 - drafted as documents
 - translated into artifacts
 - decomposed into features
 - captured in doc objects, spreadsheets, and models
- **Some challenges include :**
 - subject to interpretation
 - not easily reused or repurposed
 - difficult to achieve consistency
 - quickly becomes irrelevant (shelf-ware)

Future State

•4

- **Tomorrow requirements could be :**
 - drafted as capabilities and features which are aligned with services (business & infrastructure)
 - captured as business rules, metadata, metrics, and function points within rules libraries, metadata repository, process models, and analytics models
- **Some of the benefits may include :**
 - reuse of requirements (all levels of granularity)
 - high degree of consistency, relevancy, and usability
 - Requirements become part of the solution (subject to version management & part of configuration mgmt.)

Project Artifacts to Operational Guidance

•5

- **Metrics are used for verification and validation to ensure quality of projects (across their lifecycle) are used to:**
 - control tolerances for all categories of requirements (all levels of granularity) for products, services, and operations across their lifecycles (while in service)
- **Success Criteria are acceptable thresholds of performance covering (but not limited to):**
 - projects & test plans (all types of testing)
 - control charts and certifications
 - products & services

S-IPO-C

•6

Intputs (BAI)

- 1) Sample reports
- 2) Prototypes
- 3) Screen Mock-ups
- 4) ID Bus. Problem/Need
- 5) What is client trying to solve?
- 6) List of prioritized features
- 7) Strategic Product Roadmap
- 8) VOC
- 9) Non-functional Perf. Req.
- 10) SLR**
- 11) Bus. Rules
- 12) Bus. Constraint Assumptions**

Processing (BAP)

- 1) ID Skills / Resources
- 2) Training on Req. Proc/Method.
- 3) Common Document Template
- 4) Publish Glossary
- 5) ID Req. Workflow
- 6) Statistical Analysis
- 7) Research Tools

Outputs (BAO)

- 1) List of Prioritized Features
- 2) Features by Magnitude
- 3) ID Depend. & Rel. Impact
- 4) List Business of Assumptions
- 5) Business Process Flow
- 6) Scope SOW
- 7) Bus. Constraints
- 8) Bus. Rules
- 9) Traceability Matrix
- 10) Use Case
- 11) Storyboards
- 12) Test Scenarios
- 13) User Documentation
- 14) Sample Deliverables
- 15) Context Diagrams
- 16) Architectural Diagrams
- 17) Non-functional Req.
- 18) Screen Mock Ups
- 19) Use Case

This is one model for aligning inputs, processes, and outputs for current state business analysis.

A new model would need to be proposed for the future state requirements (as depicted in the “big picture” and subsequent slides above.
