

CAEAP: Metadata Model

Proposed meta model to support CAEAP's Collaboration Needs

Jeff Wallk
Director of Product & Services

Reference Model

- Metadata ontologies can be derived from 3 core meta models (Functions, Resources, and Content). We can derive necessary metadata from them individually or collectively via relationships between the nodes in the ontologies.
- The model is simple and can be applied to any type of need assuming we've done a good job of defining the base classes up front.
- The model scales to any volume and level of complexity, however for CAEAP's purposes I would recommend we maintain a minimal number of hierarchies and taxonomies as our resources are limited.

CAEAP Collaboration Model

Collaboration Framework

A few common components which you may want to leverage across all communications)

Subject: CAEAP: <Action> <Topic>

Meta Tags: CAEAP <Content Type> <Domain Category> <Domain Function>

Lineage & IP: <Author> <Date> <CAEAP Name + Copyright Disclaimer>

Rule #1: Content should be Referenced NOT Replicated
Rule #2: Distribution of content must be approved by TBD
Rule #3: Consistent use of the above doc "components"

Core Ontologies for Metadata

Challenges

- We don't have tools to centrally manage metadata
- We don't have a metadata repository that integrates with all of the collaboration tools
- We don't have a way to ensure the metadata is consistent across all the collaboration tools
- Initial load and ongoing maintenance of metadata across all metadata tools will require manual effort
- We don't have a way to integrate information and mine data across all the collaboration tools
- We don't have a way to search for information across all the collaboration tools

Benefits

- Facilitate integration and repurposing of knowledge
 - Provide broad search and retrieval capabilities
 - Increase reuse and decrease redundancy across knowledge providers
- Simplify and complete the knowledge life-cycle
 - Reduce the number of user-facing knowledge entry points by using already existent business processes
 - Manage knowledge end-to-end from initial inception to final disposition

- Increase the value and quality of knowledge
 - Build intelligent relationships among disparate sources of content using a federated metadata framework
 - Define, enforce, monitor processes/procedures on knowledge collections to ensure quality
- Consistent information security and disclosure enforcement
 - Knowledge must be aligned via traceable and versioned metadata to ensure knowledge is consistent in order to facilitate disclosure policy compliance and information sharing for partners

Implementation Plan

- Create initial set of metadata
 - Small team (Jeff W. & Don H.) to define the initial set of metadata for the PPG Workstream
- Review & approve initial metadata
 - PPG PMO to review and approve
 - Mike K. to review & approve
 - Marc P. to review & approve
- Rollout metadata in all collaboration tools
 - Small team + Mike K, Marc P, & PMO
- Review & maintain metadata
 - Small team + Mike K, Marc P, & PMO

Governance Plan

- Small team + Mike K, Marc P, & PMO will comprise the governance team
- Periodic reports will be run from all the collaboration tools and supplemented with observational data to assess gaps in alignment with metadata
- The Governance team will recommend corrective action to address compliance issues with metadata
- Team will decide how much freedom to allow to users of the collaborative tools to extend the metadata model

Initial Set of Metadata
