

# LEAD

Leadership for  
Enterprise Architecture  
Design

## **Proposal for New “Type” of Architecture Organization**

---

Gather a few passionate EA practitioners who want to create an approach focused on the art & science of design applied to systems and organizations trying to address expanding complexity, connectedness, and explosive growth around information, knowledge, and autonomous learning.

The art involves the application design principles covering a variety of architecture disciplines for solutions and roadmaps across business units and the enterprise.

The science involves applying measures to the practicum so we can provide evidence for supporting design approaches, artifacts, and governance.

Ideally, I would like to build a set of graphics and templates along the lines of SAFe and incorporate a set of artifacts that we can incorporate from our respective practices and those from other practitioners. We invite practitioners to present their artifacts and suggestions for review by a committee of practitioners for review and submission approval to expand/enhance the practice of EA.

We can publish the templates, artifacts and graphics for use by practitioners (CoP) who subscribe for a modest fee (not like LEADing.org which charges a fortune). We can invite participation by universities to extend the science portion with research.

Not willing to go down the path of certification etc. Let's keep this as a community of practice and just build engagement, participation, and references from practitioners who provide leadership in the design of EA.

Would be nice to hold Design Reviews for practitioners as way to augment their work and provide them with insights from fellow practitioners (something completely missing in most every org.).

Was also thinking about the idea of holding Design competitions - again focusing on design. We can include other experts in design from institutions and organizations. Again, focusing on Design not technology. Tech is playing a shrinking role in design...more is falling on information and knowledge where autonomous tools and services can be engaged. We can take this right into industry 4.0 and see where the journey goes.

Thoughts ?
