

Applied Enterprise Architecture “Reader Reference – meta model”

The purpose is to set a contextual/common reference frame by which to group related titles and help the reader find content related to their area of interest.

The AEA document and business scenario catalog be broken down into 6 major “sections” as we step through the value delivery model (see below):

Value Delivery Model (Steps)	Business Scenarios
Value Definition	New Product & Service Capabilities Portfolio Management Opportunity Harvesting / Innovation Business Capabilities Compliance Competitive Analysis Business Efficiency/Effectiveness IT/Business Trends Analysis
Concept / Product Dev	Corporate or Business Strategic Planning IT/Business Portfolio Management IT Service/Business Sourcing Strategy
Investment Planning, Resource Allocation, & Budget Mgmt	Operations Risk Management Mergers, Acquisition and Divestitures Business Continuity Operations Management Organizational Restructure / Consolidation

The **Value Proposition** is defined here

The **Profit System (Bus Case)** is defined here

The **Operational Capabilities** are defined here

	Business/Technology Trade Off Analysis Risk Management Business Optimization Business Transformation Business Lifecycle Planning Corporate Governance Consolidating Suppliers Across the Supply Chain IT and Business Process Outsourcing and Off-shoring Business Line Retirement
Operational Execution	Technology Enablement Business Resiliency Planning
Delivery & Logistics	
Value Assessment	Knowledge Management Corporate Performance

Actions Required:

- We need to agree on the definition and format for a “scenario”. The above items appear to be on different levels of granularity and focus (processes, topics, scenarios, objectives).
- Assuming the ref model makes sense, we probably need to fill in some of the holes / gaps
- Once we define scenarios in a more consistent manner, it may be useful to map dependencies between scenarios (much the way we do this in our heads today).
- We can then identify the entry points for EAs to step into these scenarios to maximize value and minimize risk for the organization.
