CM as an enabling constraint for CI

Change reviews and approvals

Workflows and sign-offs

Variant/variance availability/applicability

Status accounting

CM as an enabling constraint for CI

- Constraints enable the system to function
- Focusing solely on ease of use makes it easy to create a pile of unmanageable mess
- Focus should be on identifying the constraints and making it easy to satisfy them
- Constraints must be built into the core of the system

CM Tooling

A DevSecOps CI/CD Workflow does NOT mean “No CM”

Core CM principles per SAE EIA649-C can definitely be implemented in a DevSecOps CI/CD flow.

Good CM, bad CM, or no CM is not a tool/process question, it is an organizational culture question.

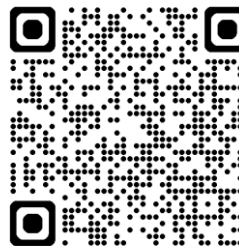

DO: Use tools to handle complexity. DON'T: let the team off the hook.
