5.2 Executive Summary

Hyperion Solutions (UK) Ltd and PureApps are delighted to respond to Charter plc request for a proposal for delivering one core business process Consolidation and Reporting solution. We have a compelling story to tell in this area having amassed the skills, experience and business knowledge to help hundreds of customers improve their consolidation process.

We believe we can offer Charter plc the following key advantages

- 1. The lowest risk solution that will enable Charter plc to confidently deliver statutory and management reports for regulatory compliance and insight into their business.**
- 2. The most scalable, open and integrated architecture upon which Charter plc can build for current and future business requirements.**
- 3. The most experience in delivering proven out-of-the-box consolidation and Business Performance Management solutions ensuring Charter plc achieve the quickest return on their investment.**
- 4. A complete solution recognising the requirement for a 3rd party to assist in the hosting/technical environment.**

Through a combination of People, Process and Technology we will deliver the following to Charter plc.

- Provide a complete Statutory and Management Consolidation and Reporting solution for Charter plc with a live working consolidation solution that users are confident to use and provides more detailed analysis of business performance. Phase I
- Provide a comprehensive analysis capability across higher volumes of data so that the business is confident in the accuracy and relevance of the analysis. Phase II
- Provide a framework with which Charter plc can deploy at a later stage integrated functionality for Budgeting, Planning, Forecasting, M&A or Debt Modelling, Balanced Scorecard Strategy Setting, KPI Dashboards and full enterprise wide Business Intelligence. Part phase II & phase III
- Provide an optional outsourcing capability, through a Hyperion partner, K2, who will manage and support the technical infrastructure inside Charter plc

This will enable the following benefits for Charter's business

- The cornerstone of compliance for a company listing on the LSE
- Transparency and visibility of Charter's numbers to stand up to scrutiny from the regulatory authorities and the investment community.

- A reduction in the time to consolidate allowing Finance to spend more time on valuable analysis.
- Over time to reduce the manual keying of data to minimise data entry errors and also to increase access to higher volumes of data captured facilitating more accurate analysis and more trust in the numbers

To deliver this we are proposing

Hyperion System 9 Software, which may be implemented in phases according to the requirements of Charter and the priorities outlined.

Our Investment Summary in **Appendix J** shows pricing for a comprehensive solution enabling users to access ALL modules.

However, Charter should be aware that Hyperion are able to deliver specific solutions as required by Charter and if the focus is Phase 1, being the delivery of one core business process Consolidation and Reporting solution, the investment in software will be considerably less than the summary level investment.

For Phase 1 - delivering one core business process Consolidation and Reporting solution for 150 Named Interactive Users requires a Software investment of **£485,000 plus VAT**

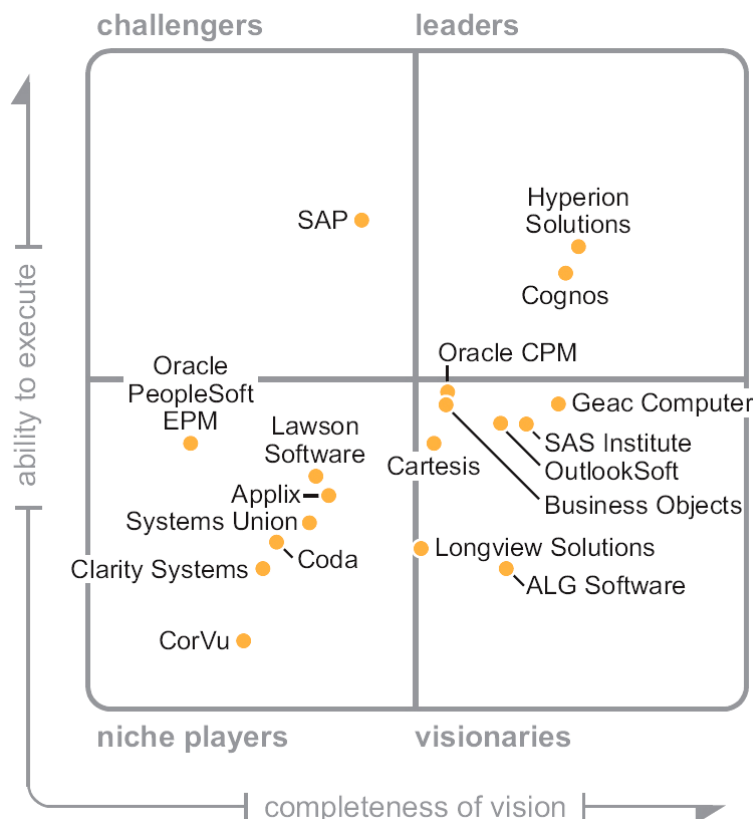

An investment from Charter in the sum of £988,000 plus VAT is required for the comprehensive software for all functionality as indicated in **Appendix J**.

Hyperion would like to highlight that we are mindful of the competitive nature of this Request for Proposal and will be pleased to enter into negotiations if our solution is the preferred option by Charter.

Overview of Hyperion

We are the leading provider of Business Performance Management software, which enables companies to translate strategies into plans, monitor execution, and provide insight to manage and improve financial and operational performance.

Our leadership in this field, within which Consolidation lies, is validated by Gartner.

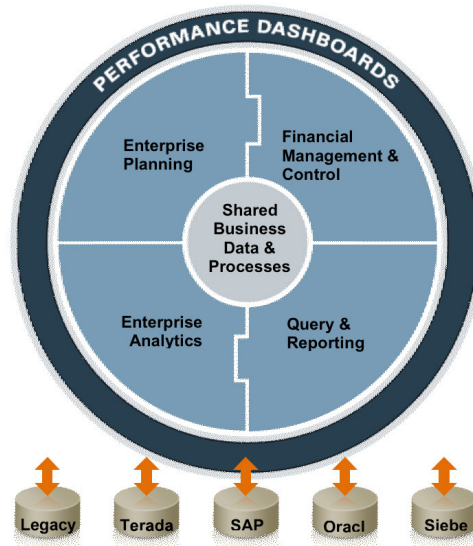

The Magic Quadrant is copyrighted 2005 by Gartner, Inc. and is reused with permission. The Magic Quadrant is a graphical representation of a marketplace at and for a specific time period. It depicts Gartner's analysis of how certain vendors measure against criteria for that marketplace, as defined by Gartner. Gartner does not endorse any vendor, product, or service depicted in the Magic Quadrant and does not advise technology users to select only those vendors placed in the "Leaders" quadrant. The Magic Quadrant is intended solely as a research tool and is not meant to be a specific guide to action. Gartner disclaims all warranties, express or implied, with respect to this research, including any warranties of merchantability or fitness for a particular purpose.

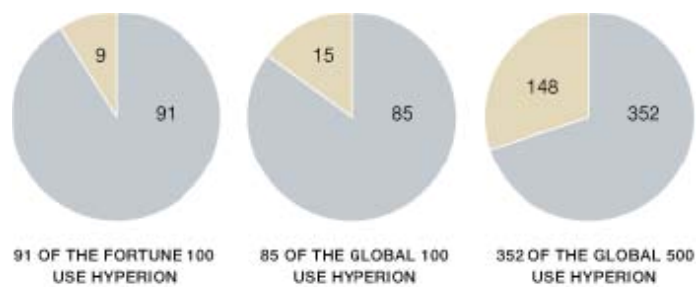

Hyperion provides customers with solutions that include analysis and reporting tools, a business intelligence platform, packaged and tailored applications, and related services. Our solutions support the enterprise-wide process for proactively managing any business toward optimal performance against goals and for anticipating and forecasting results.

Business Performance Management builds on business intelligence (commonly referred to as query, reporting and analysis), which provides information (including historic analysis, statistical predictions, and forecasts) that helps managers understand how their business is performing at any moment in time. Using data from transactional systems such as accounting, billings, bookings, supply chain, sales force automation, and call centres, our Business Performance Management solutions are used by employees at all levels across organisations – in the finance department and beyond – to provide a single version of the truth about an organisation's performance. Organisations can then

leverage this information, which is presented in intuitive, easy-to-understand graphical views, to support continuous performance improvement and accountability.

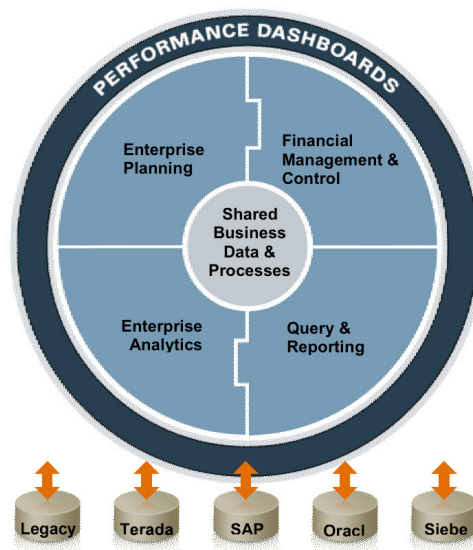

Hyperion’s innovative solutions are used by more than 11,000 organisations worldwide to speed the calculation of key business metrics, facilitate planning and forecasting functions, and empower users to gain knowledge through strategic, value-added analysis. Hyperion’s customers include more than 91 of the Fortune 100, 85 of the Global 100, and 352 of the Global 500 companies.

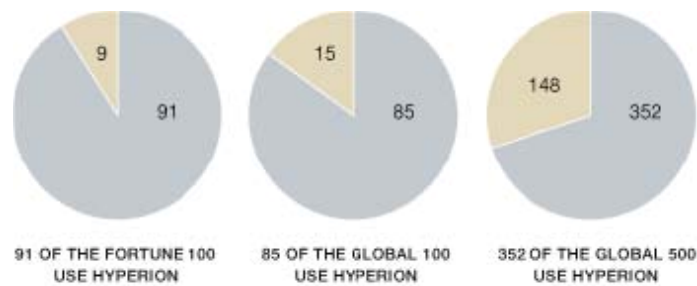

5.3 Company Background

Hyperion Solutions Corporation is a leading provider of business performance management software. Hyperion offers the industry's only business performance management solution that integrates financial management applications with a business intelligence platform into a single system. Business Performance Management builds on business intelligence which is commonly referred to as query, reporting, and analysis and enables companies to translate strategies into plans, monitor execution, and provide insight to manage and improve financial and operational performance.

Hyperion solutions support the enterprise-wide process for proactively managing any business toward optimal performance against goals and for anticipating and forecasting results. Our solutions enable customers to collect, organize, and analyze data from disparate transaction systems such as accounting, billings, bookings, supply chain, sales force automation, and call centers. Employees at all levels across organisations – in the finance department and beyond – use our products to understand their company's unique business drivers, align goals across the organisation, monitor performance against these goals, and make adjustments as insights and opportunities arise to gain a competitive advantage.

Hyperion's innovative solutions are used by more than 12,000 organizations in 90 countries worldwide to speed the calculation of key business metrics, facilitate planning and forecasting functions, and empower users to gain knowledge through strategic, value-added analysis. Hyperion's customers include more than 91 of the Fortune 100, 85 of the Global 100, and 352 of the Global 500 companies.

For Hyperion, customer satisfaction is the overriding priority. Over one third of Hyperion's 2,700 worldwide employees are dedicated to customer service and support. The Hyperion service organisation provides and continually enhances worldwide support for all of its products. We offer an extensive selection of worldwide training, consulting, and technical support services to install, implement, and support our products. In addition, nearly 600 leading consulting, systems integration, and education partners enhance choice and flexibility for Hyperion customers by providing vertical and horizontal application expertise, implementation services, education, and turn-key solutions.

Hyperion's vision is to *Breakthrough Performance Everywhere!* Our mission is to define and lead the Business Performance Management software category and create unprecedented value for our customers, shareholders, partners, and employees. Hyperion's objective is to profitably gain market share as the leading global provider of Business Performance Management solutions. Key elements of Hyperion's strategy include:

- Be the Management System for the global enterprise
- Maintain Hyperion's leadership in Finance with System 9 and leverage that strength to further penetrate operational BI
- Drive continued product innovation
- Drive growth through additional acquisitions
- Expand strategic partner relationships

5.4 Proposed Solution

Based on the requirements provided in the Charter Plc RFP for Project Apollo, Hyperion recommends a solution utilising Hyperion System 9. A summary description of the solution is provided below.

Overview of Hyperion System 9

Hyperion System 9 is the most comprehensive and flexible business performance management (BPM) system in the marketplace today. It is a solution that integrates a modular suite of financial management applications with the most comprehensive business intelligence (BI) capabilities for reporting and analysis. It is integrated, easy to use, easy to manage, and the lowest in cost to deploy.

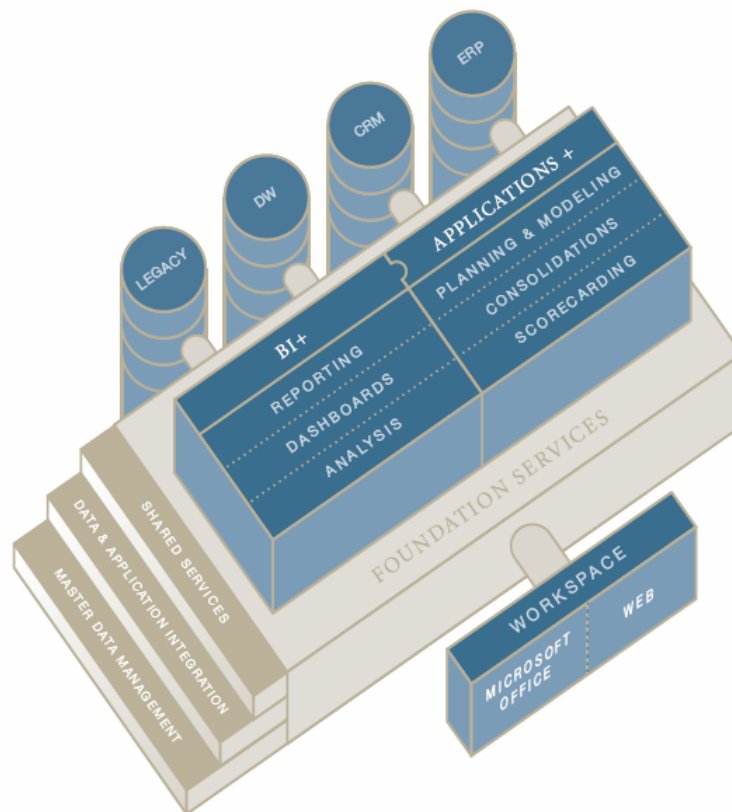

Hyperion System 9 gives you consistent visibility into your past, current and future business operations so you can confidently plan and trust the reliability of your reports. This helps you sustain improved performance and increase the overall health of your organization. Further, Hyperion System 9 improves business agility since you can make better, quicker decisions leveraging one reliable source of information that spans all areas of your operations. Your users gain controlled access to personalised information that is easily managed by one system that also supports your internal controls and audit requirements.

Hyperion System 9 offers the following components:

- ***Hyperion System 9 Applications+*** - provides a modular suite of integrated financial management applications for managers, analysts, and executives who need to gain visibility into performance, improve forecast accuracy, and respond quickly to changing market conditions. Hyperion System 9 Applications+ lowers the cost of compliance and mitigates business risk through integrated process control and consistent planning, financial consolidations, reporting, and scorecarding. Productivity is increased by delivering shorter cycle times for financial closing and planning, while increasing reporting and planning accuracy. Business agility increases when you can effectively link strategies to plans and continuously monitor execution, optimizing your organisational resources, while meeting shareholder expectations.
- ***Hyperion System 9 BI+*** - provides a comprehensive BI platform that supports all types of reporting and analysis through a context-driven, thin-client user interface—from interactive dashboards to structured operational and financial reports, ad hoc queries, and advanced OLAP analysis—all within a single environment. Hyperion System 9 BI+ also integrates with and enhances the use of Microsoft Office. All of these features provide improved transparency, visibility, and decision making throughout your organisation.

- **Hyperion System 9 Foundation Services** – provides a suite of shared services for creating, deploying, and managing Hyperion System 9 solutions in all of your departments, applications, business units, and locations. Hyperion System 9 Foundation Services offers a single point of maintenance for user authentication and metadata sharing, as well as shared infrastructure services that can be deployed centrally. Metadata versioning and synchronization allow you to manage change that occurs with business data and synchronize those changes across the Hyperion product suite. Hyperion System 9 Foundation Services also provides easy integration and interoperability with existing IT assets.

Hyperion System 9 is graphically represented below:

With Hyperion System 9 software, you can have award-winning and integrated BPM application modules, a comprehensive BI platform with the industry's broadest range of management reporting and analysis capabilities, and Foundation Services that are easy to deploy and support. You can have them in one system that's easy to use - even for non-technical workers - Hyperion System 9.

Overview of Hyperion System 9 Planning

An integral part of the Hyperion System 9 suite of products, Hyperion System 9 Planning is a Web-based budgeting and planning solution that drives collaborative, event based

operational planning processes throughout the organisation for a wide range of financial and operational needs. Hyperion System 9 Planning is a comprehensive approach for the complete and closed loop planning process that drives continuous business improvement. With Hyperion System 9 Planning, all decision makers and front-line managers can communicate which course of action to take and get budget holders to collaborate so that the planning process is optimized and efficient.

Hyperion System 9 Planning reduces planning cycles and improves analysis capabilities. The software allows you to track and monitor business plans and forecasts, so you can easily and efficiently translate strategic objectives into operational goals and targets. You can centrally manage and collaborate on every step of the planning process, and communicate targets to all decision makers through the Internet and intranet using a standard Web browser. Thus, more users can be involved on a more frequent basis. Such involvement will help ensure that your plans and predictions are more accurate, which is particularly important in today's volatile business environment.

The Hyperion System 9 suite is interoperable and integrated so your company can improve its performance management initiatives. Working together, the modules help companies focus resources, improve operational efficiency, manage for profitable results, and leverage opportunities for growth everywhere in the enterprise. As your goals and resources dictate, you can add additional business performance management functionality.

Overview of Hyperion System 9 Financial Management

Hyperion System 9 Financial Management is a Web-based, enterprise-class financial consolidation and reporting application with powerful multidimensional analysis capabilities.

Hyperion System 9 Financial Management helps organisations shorten the financial consolidation and reporting cycle while providing more in-depth analysis capabilities. It provides enhanced decision-support capabilities to employees across the enterprise and allows organisations to continually adapt and align strategic and operational plans. Ultimately, this leads to better execution and greater bottom-line financial returns.

The system uses today's most advanced Web technology, yet is designed to be used and maintained by the finance team. With purpose-built features, Hyperion System 9 Financial Management is the cornerstone of any sustainable compliance framework and helps businesses comply with today's stringent reporting regulations on an ongoing basis.

Part of the Hyperion System 9 suite of Business Performance Management applications, Hyperion System 9 Financial Management is modular and can be used stand alone, as well as integrated with other System 9 applications to deliver even more comprehensive functionality, greater administrative ease-of-use, and faster deployment. Working together, the System 9 modules help companies focus resources, improve operational efficiency, manage for profitable results, and leverage opportunities for growth.

5.4.1 Detailed Functional Requirements Questionnaire

See Section 5.8 **Appendix A** - Detailed Functional Requirements.

5.4.2 Detailed Non-Functional Requirements Questionnaire

See Section 5.8 **Appendix B** - Detailed Non-Functional Requirements.

5.4.3 Implementation Services

See Section 5.9 Hyperion Appendices, **Appendix 2** and **Appendix 7** for Supplemental Documentation.

5.4.4 Production Hardware

5.4.4.1 User Numbers, Profile by Type and Location

The solution is a suite of purpose built modules.

The Planning module offers four types of users. Each is briefly described below.

- Administrator
- Interactive User
- Planner
- View User

Administrator

Users who are designated as administrators can perform any task in the application and during financial processes, except delete the application or claim ownership of an application. The administrator who is designated as the application owner is the only user who can delete an application. Administrators can perform the following types of tasks:

- Create applications.
- Manage security.
- Maintain metadata.
- Initiate and manage the budget process (for example, start planning units).
- Designate the e-mail server for e-mail notification.
- Create and maintain Web-based data forms.
- Create and manage task lists.
- Create and maintain Smart View worksheets.

- Create and maintain reports using Financial Reporting (if designated with the Designer role).
- Create and launch adapter processes using Hyperion Application Link.
- Create and launch business rules using Business Rules.
- Enter, view, and delete data.

Interactive User

Interactive users can perform the following tasks:

- Enable e-mail notification (for themselves only).
- Create and maintain Web-based data forms.
- Create and manage task lists.
- Create and maintain Smart View worksheets.
- Create and maintain reports using Financial Reporting (if designated with the Designer role).
- Create and launch adapter processes using Hyperion Application Link.
- Create and launch business rules using Business Rules.
- Enter, view, and delete data.
- Submit information and data for approval. They can then control this process, sign off, reject, pass plans to another level, verify the plans with other parts of the organization, and so on. For example a sales director may collect all the planning information for sales managers. Before signing this off, a manufacturing director can review new forecasts based on production capacity.

Interactive users **cannot** create and maintain applications, dimensions, exchange rates, users or access rights assignments. Examples of interactive users are department heads, sales directors, and business unit managers.

Planner

In most cases, planners comprise the majority of users. Planners can perform the following tasks:

- Enable e-mail notification (for themselves only).
- Input, submit, and view data.
- Use reports that have been built by others.
- Run data integration routines designed by others.
- Execute business rules and other processes associated with validating and preparing data.
- View and use task lists.
- Use Smart View.
- Use any data access tools for which they are licensed (for example, Web Analysis).
- Submit information and data for approval. They can then control this process, sign off, reject, pass plans to another level, verify the plans with other parts of the organization, and so on.

Planners are subject to the restrictions placed on interactive users. In addition, planners **cannot** create and maintain reports, adapter flow diagrams, or business rules.

View User

A view user has limited access to view data in a Planning application. Typically, the view user is an executive who wants to see business plans during and at the end of the budget process. View users can use any data access tool for which they are licensed; for example, Planning Web Client, Financial Reporting, Smart View, Web Analysis, and so on.

The Financial Consolidation module offers four types of Users. Each is briefly described below.

Power Manager

This user is an administrator. These users can do everything both in the application and during the financial processes - including the creation and maintenance of security, application structures, and dimensions.

Interactive User

Can input, submit, view and consolidate data, manage the process and control versions in the application. They can create and maintain allocation scripts, business rules, and other calculations.

They can also maintain and create reports and data entry grids for use by themselves and or other users. Interactive users can also create, maintain, and run integration routines.

Users can submit information and data to the Interactive User and Power Manager for approval. They can then control this process, sign off, reject, pass to another level and / or verify the plans with other parts of the organization etc. For example a sales director may collect all the planning information for their sales managers. Before signing this off they could ask a manufacturing director to review and approve (or not) new forecasts based on production capacity.

The Interactive User cannot create and maintain applications, cannot create and maintain dimensions, users, or security. Examples of an Interactive User could be a department head, sales director, or business unit manager.

Basic User

The basic user can input, submit, view, and consolidate data.

They **cannot**: manage the process - Approve, Reject, Sign-Off etc, create or maintain reports, integration routines or allocation rules. They will of course be able to submit their information to someone else in the company but not manage the planning units from other users.

They **can**: use reports built by others, run data integration routines designed by others, execute allocations or business rules and other processes associated with validating and preparing data. They can use any data access tools for which they are licensed.

View User

Can only view - typically this type of user is an executive that just wants to see the data and reports. They can use any data access tools for which they are licensed.

In addition, there are specific user tasks for security administration, allowing the creation of a user who may add users to an application and assign access, but not have any rights to data or his own security.

5.4.4.2 User Concurrency

The solution is a true multi-user application and can support thousands of users. Users from any location can access the system at the same time to perform any task or activity for which they have sufficient privileges.

5.4.4.3 Recommended Hardware Configuration

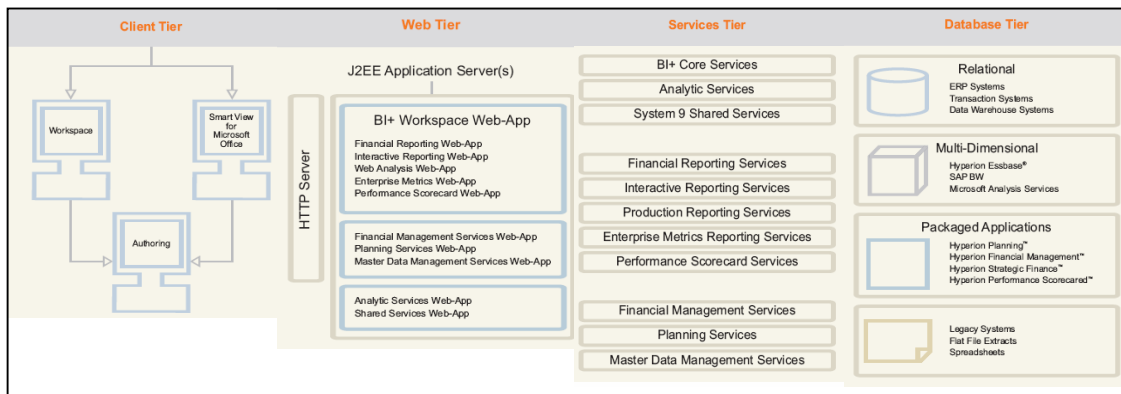

Summary Overview

Hyperion System 9 is a unified approach to Business Performance Management (BPM), incorporating functional breadth in both Financial Applications and Business Intelligence (BI) Tools –all in one product set. The solution is easy to use, manage, and maintain, providing business users with a single point of access to all of their BPM content and central points of administration.

Hyperion System 9 is built using Service-Oriented Architecture (SOA) principles and modern technologies, such as DHTML, CSS, XML, JavaScript, and J2EE¹. It embraces the Rich Internet Application paradigm by leveraging AJAX techniques, offers an unparalleled user experience, and conforms to the demanding standards set by today's IT organisations.

Hyperion System 9 is an n-tier, scalable solution. Our “start anywhere” philosophy allows companies to prioritize their needs, install only the services necessary, and then deploy solutions as required. Conceptually, the Hyperion System 9 architecture consists of multiple processing tiers: Client, Web, Services, and Data. An illustration and description of each tier is provided below.

¹ Hyperion Financial Management is based on the same conceptual architecture implemented leveraging a Microsoft technology stack.

The Client Tier

The client tier consists of three main components:

- *Hyperion System 9 Workspace* - The Hyperion System 9 Workspace is a rich, zero-footprint user environment delivered via DHTML. The Hyperion System 9 Workspace incorporates a “business process-based personalization”, which is fully customizable based on individual or group needs.
- *Authoring Studios* - Hyperion System 9 includes expert authoring capabilities for the Web tier reporting modules.
- *Smart View for Office* - Hyperion System 9 Smart View for Office is a single Microsoft Office add-in that allows business users to work directly in the Office environment (Excel, Word, PowerPoint, Outlook) while interacting live with their Hyperion BPM content, supporting a bi-directional workflow, data entry, highly formatted presentations, Excel formulas, comprehensive application security, and dynamic updates.

The Web Tier

The Web tier manages brokering of requests to the appropriate and distributed set of services. The Hyperion System 9 architecture leverages industry standard Java 2 Enterprise Edition (J2EE) Web application servers, automatically inheriting the highly scalable Web-oriented capabilities built into these technologies, such as fault tolerance, rapid deployment, clustering, and failover. The Hyperion System 9 Web tier consists of a collection of Web applications constructed as servlets and jsp pages. These purpose-oriented Web applications incorporate logic specific to the type of BPM functionality to be delivered.

Hyperion System 9 Master Data Management (MDM) ensures consistency of all master data and data structures across BPM environments of all sizes, eliminating costly manual master data management processes. It supports SOAP/XML via Web Services, integrating BPM master data changes into lights-out maintenance and integration processes.

The Services Tier

The distribution of services provides isolation, fault tolerance, and expanded scalability capacity. With a scalable solution, organizations can be confident in their ability to grow their user community, increase their data volumes, and add new applications.

The BI+ Core Services are a collection of services that manage the general infrastructure of Hyperion System 9. These include replicable services, such as authorisation, authentication, session management, usage, and logging, as well as event (alerts and scheduled jobs) management and repository management.

The services that deliver specialised BPM functionality are purpose-built to provide the content for analytic, reporting, application, and data access capabilities of Hyperion System 9.

The Database Tier

Hyperion System 9 architecture leverages the optimal database technology to deliver the requisite business functionality required by the application, taking advantage of what multi dimensional and relational technology have to offer to. Hyperion System 9 reporting tools supports access to wide variety of relational, legacy, and multidimensional sources. Communications protocols are used based on data source, e.g., MDX, BAPIs, JDBC, and OCI. Hyperion System 9 has been optimized for access to SAP BW. Direct BAPI access to SAP BW facilitates financial reporting, production reporting, and ad-hoc analysis of SAP BW data, with the ability to blend SAP BW, transactional and relational data in the System 9 Workspace.

Detailed Description

Please refer to the System Requirements provided in Section 5.9 Hyperion Appendices, **Appendix 1** of this document for detailed information regarding the solution's hardware requirements. We have also completed Charter's **Appendix D and E** as requested.

5.4.4.4 Scalability

Built using high-performance, scalable architecture, the system enables organisations to deploy a robust budgeting and planning solution that is designed to lower the total cost of ownership and simplify deployment to thousands of users.

The solution provides a scalable, n-tier, Web-architected system, with the ability to add additional mid-tier components to scale and support large numbers of users. The system supports load balancing technology to provide high availability (also known as failover) and scalability.

5.4.4.5 Resiliency

The solution supports load balancing technology to provide high availability (also known as failover) and scalability. Load balancing is a way of dividing concurrent usage as equally as possible across a cluster of servers. If you are using multiple application servers, you can specify clusters of application servers through which to distribute the load. By implementing load balancing, Hyperion applications can support more users with more efficient use of servers and with less risk in the event a server goes down. Tests performed within Hyperion Solutions and in third party labs demonstrate that Hyperion Financial Management and Hyperion Planning can scale up to thousands of users when using clustering/load balancing technology.

5.4.4.6 "Remote Access Solution" -Citrix/WTS etc.

See Section 5.9 Hyperion Appendices, **Appendix 3**

Hyperion System 9's User Interface is predominately web-based. Therefore, as long as a user has access to the servers remotely e.g. via VPN and also has Microsoft Internet Explorer then they can launch the web-based interfaces as usual.

Terminal Services

Another option to use Hyperion System 9 remotely is to allow terminal service access via Remote Desktop to an internal machine on the network. Users can then launch web-based interfaces via Internet Explorer on these machines. Also, if the user has Remote Desktop to the server, they can even run Administrative consoles such as Analytic Administration Services to access features which may not be web-based.

Citrix

Such administrative consoles may similarly be accessed via Citrix. This may incorporate with your existing remote access solution, thus avoiding the need to setup additional methods.

Recommendation

The recommended option for remote access is Web-based. However, if there is a need to use certain features not available via the web, then terminal services or Citrix can serve these needs.

Other Considerations

IT should be aware of the firewall issues regarding any remote access. Hyperion can provide required port numbers which need to be open for remote access.

5.4.5 Development Hardware

See **Appendices D and E** if a like for like solution is required for Development and testing. However, we would suggest the following Servers combined to save resources;

1. Database and Foundation Server
2. Both BI Servers
3. Planning and Analytic Services
4. Financial Management Application and web server.

Test and Development Definition

A deployment of Product software to be used for test and development purposes only. The deployment is licensed at the same Tier level as the related base Product, and with the same number of Named Power Users, Named Interactive Users and Named View Users.

5.4.6 Standalone Test System Hardware

We are assuming that Charter would like the ability to have a test system on a Laptop and hence the following specification is a probable solution.

LAPTOP SPEC.

DUAL Core 2 GHz+ Minimum CPU
Maximum possible RAM 4GB or more
80GB Hard Drive Min

When a Test and development server license is purchased, Charter will be able to install software on additional hardware. This may be a complete system for testing.

5.4.7 Client Hardware & Software

Please refer to the System Requirements provided in **Appendix D** of this document for information regarding the client hardware and software requirements.

5.4.8 Back End Software

Please refer to the System Requirements provided in **Appendix E** of this document for information regarding the solution's software requirements.

5.4.8.1 Third-Party Software

Please refer to the System Requirements provided in Section 5.9 Hyperion Appendices, **Appendix 1** of this document for information regarding the solution's third-party software requirements.

5.4.8.2 Vendor's Proprietary Software

The solution allows you to "start anywhere" and enjoy fast time-to-value. It supports custom and tailored applications to address unique requirements; integrates with and complements existing transaction, warehouse, and other data sources.

Part of the Hyperion System 9 suite of Business Performance Management applications, Hyperion System 9 Planning and Hyperion System 9 Financial Management are modular and can be used stand alone, as well as integrated with other System 9 applications to

deliver even more comprehensive functionality, greater administrative ease-of-use, and faster deployment. Working together, the System 9 modules help companies focus resources, improve operational efficiency, manage for profitable results, and leverage opportunities for growth.

5.4.8.3 Interfaces and ETL Capability

The solution provides data transformation and loading capabilities from a wide range of sources including: flat files, spreadsheets, relational databases or middleware, and ODBC compliant data sources. Further, Hyperion Smart View provides dynamic data entry and offline capabilities through Excel to users for added flexibility with planning and financial management.

5.4.8.4 Product Lifecycle

Hyperion's response to the information requested in section 5.4.8.4 of the RFP is provided in **Appendix B** - Detailed Non-Functional Re.xls.

5.4.9 Responses to Supplier Commercial Appraisal

Hyperion's response to the information requested in section 5.4.9 of the Charter Plc RFP is provided in **Appendix F** and in the file called "Supplement to the Response to **Appendix F.doc**" which contains information requested in **Appendix F** that could not be provided in the file as adequate space for a complete response was not available.

5.4.10 Post-implementation Maintenance and Support Services

Hyperion's response to the information requested in section 5.4.10 of the RFP is provided in **Appendix B** - Detailed Non-Functional Re.xls.

Different types of ongoing support are available after the implementation of the software is complete and your application is in production. Hyperion provides the following ongoing support and information to clients who have current Software License and Services agreements:

- Standard telephone and internet technical support services
- Software releases and updates
- The ability to purchase Education Services, Consulting Services, and Customized Support services

CONFIDENTIAL INFORMATION

5.5 Charges

A Summary of charges has been given as requested in Section 5.8 Charter Appendices, **Appendix J**

5.5.1 Software

The following Hyperion Software is required;

Hyperion System 9 Business Performance Management Bundle

Includes: Foundation (including Workspace, Smart View for Office, Shared Services), Financial Management, Planning Standard Edition, Strategic Finance, Performance Scorecard, HAL Basic and BI+ Interactive Reporting, Essbase Analytics, Enterprise Analytics, Web Analysis, Financial Reporting, Production Reporting, Enterprise Metrics and 64-bit Support for Analytics.

Note: All products within BPM bundle may have up to 10 instances, except for System 9 Financial Management (which has unlimited instances).

(Enterprise Tier Unlimited Users Up to 10 Instances) - **£ 401,000**

Named Users

The following Named Users can access Financial Management, Planning Standard Edition, Workforce Planning, Strategic Finance, Performance Scorecard, and any of the BI+ Modules.

Named Power User - £ 17,000

Named Interactive User - £ 2,900

Bundle Named View User £ 975

We have assumed that Named interactive users are the most likely user type, however we can amend this as required.

150 Named Interactive Users - **£ 435,000**

Test and Development Deployment

A deployment of Product software to be used for test and development purposes only. The deployment is licensed at the same Tier level as the related base Product, and with the same number of Named Power Users, Named Interactive Users and Named View Users.

Test and Development Deployment - **£152,000**

CONFIDENTIAL INFORMATION

5.5.2 Implementation Services – Phase 1

Hyperion are unable to give a fixed price at this stage as we do not believe we have enough information regarding the implementation, however we have given a best estimate of our charges.

Our Summary of charges are **£195,800**

See Section 5.9 Hyperion Appendices, **Appendix 2** and Section 5.8 Charter Appendices, **Appendix J**

5.5.3 Other Implementation Costs

Hyperion have not reviewed Charter **Appendix G**.

Hyperion understands that after selecting a preferred vendor, Charter will enter into contract negotiations to finalise terms, conditions and fees. We understand that this RFP and the proposal/quotation, or any part thereof, may be included in and made part of the final contract.

See Section 5.9 Hyperion Appendices, **Appendix 2** (page 19)

5.5.4 Implementation Services

See Section 5.8 Charter Appendices, **Appendix J**

5.5.5 Post Implementation Maintenance & Support Services

Standard Maintenance Services are charged at 18% of the Software Licence Fee per annum. Enhanced Support Programs are available and we will be pleased to discuss these in detail. Please refer to Section 5.9 Hyperion Appendices, **Appendix 2** (page 33)

5.5.6 Hardware Infrastructure

See Section 5.9 Hyperion Appendices, **Appendix 6** for our Hosted Services Solution documentation.

5.6 Commercial Terms

5.6.1 Licence Agreements

See Section 5.9 Hyperion **Appendix 4, 5 and 8**

5.6.2 Charter Pro-Forma Agreement

Hyperion understands that after selecting a preferred vendor, Charter will enter into contract negotiations to finalise terms, conditions and fees. We understand that this RFP and the proposal/quotation, or any part thereof, may be included in and made part of the final contract.

As discussed at the meeting on 5th January between Hyperion and Charter, our proposal is that our partners PureApps and K2 will supply software, maintenance and Hosting services, which will offer Charter the ability for software to be hosted as is indicated to be the preferred method of delivery.

Hyperion will be directly responsible for delivery of the implementation of the solution using direct employees.

We expect the contractual agreements to differ from the Charter Pro-Forma Agreement and have therefore not reviewed or included responses to this document

5.7 Innovative Proposals, Additional Features and Capabilities

The response to the RFP has been completed as requested in detail and any additional information, features and capability, we feel should be specifically discussed with Charter when we hope to gain more understanding of the implementation.

However, we would like to draw your attention to the facts that Hyperion and partners are able to offer a comprehensive solution to address;

- Supply of Software and Standard Maintenance Services
- Deliver Direct Hyperion Consulting personnel and take responsibility of delivering the project at Charter if required.
- Supply a Hosting Facility as requested

With Reference to the Hosting Facility, we would like to draw your attention to Section 5.9 **Appendix 6** – Hosted Hyperion Environment, which is an illustration of a SOW and contractual agreement that our Partner K2 have experience in delivering for Hyperion and Clients.

The above are skills and methods we have experience with and we are confident that as a combination, differentiate our offering significantly, making our solution not only the most comprehensive solution on the market but one that is recognized by industry watchers as the market leading solution.

5.8 Completed Charter Appendices

Location	Description	Status
Appendix A	Detailed Functional Requirements	Complete
Appendix B	Detailed Non-Functional Requirements	Complete
Appendix C	Implementation Resource Matrix	Complete
Appendix D	Infrastructure – Client Machine Requirements	Complete
Appendix E	Infrastructure – Back End Requirements -PRODUCTION	Complete
Appendix E.1	Infrastructure – Back End Requirements -DEVELOPMENT	Complete

Appendix F	Supplier Commercial Appraisal	Complete
Appendix G	Charter Pro Forma Agreement	See Section 5.6.2
Appendix J	Summary of Charges	Complete

5.9.Hyperion Appendicies

Provided in this section are the following attachments:

- Appendix 1 – Detailed Solution System Requirements by Product
- Appendix 2 – Implementation 5.5.2, 3,4,5
- Appendix 3 – Citrix Policy
- Appendix 4 - Software Licence Agreement
- Appendix 5 – Order Schedules
- Appendix 6 – Hosting Solution
- Appendix 7 – Supplemental Implementation Docs
- Appendix 8 – Copy and Use Doc
- Appendix 9 – Screenshots to Appendix A
- Appendix 10 – Screenshots to Appendix B
- Appendix 11 – Customer List
