Digital Supply Chain = “Service Level Management”

Digital Supply Chain

New Ways of Working

New Ways of
Working

NWOW

Service Planning Model

A Service Can Be: Business, Functional, or Technical

- Capabilities are enabled by one or more services
- Each service is designed as a “mini-supply chain”
- Service Level Management is designed to ensure operational effectiveness
- Service Ownership is where we simplify Accountability (instead of relying on complex RACI models for resources)
- Measures quality, productivity, and service excellence (what gets measured gets done right)
- Service has its own business framework (revenue, cost control, measurement, supplier and customer management)
- Policies impose constraints on processes and they may require additional desired outcomes (which opens the door for innovation)

Service Planning Model

Example: Technical Service Model

Technical Service L1	Technical Service L2	List of Processes
Operations Management	Computing Service	Computing Environment Provisioning & Maintenance Server & Computing Cycle Planning & Maintenance Technical Architecture Deployment Distributed Computing Support (includes Utility Service Delivery)
Operations Management	DC Operations Service	Monitoring & Maintenance of Computing Facilities Installation & Upgrade of computing platforms Coordination with Continuity Planning teams Provide proactive monitoring & management with other service owners (availability & planning, procurement, & vendor mgmt.)
Operations Management	Event Management Service	Messaging layer services for SOA Workflow (OLTP, manual workflow, distributed, and slow-moving workflow) Auditing & Instrumentation of all events and activities to monitor for anomalies and conduct proactive trending to anticipate problems
Operations Management	Messaging & Collaboration Service	Email storage and provisioning Vendor Mgmt. and license mgmt. Distribution at the desktop, mobile, or web

Service Management

Service Providers deliver their value in both Projects and Production Support.

The processes and deliverables are the same.

The measures (SLEs) are not and that is an important differentiation.

Lifecycle Management

- Engagement
 - Planning
 - Define Requirements
 - Design Review
- Estimation
- Service Delivery*
- SLEs for Lifecycle Delivery

Operations Management

- Request Management
 - Ad Hoc
 - Consultation
 - Operations Support
 - Demand Planning
- Service Delivery*
- SLEs for Operations Delivery

*Service Breakdown

- Processes
- I-P-O
- Value Delivery

Capabilities vs Services vs Processes

❖ Capabilities

- Defines the (WHAT) for an organization does to create & deliver value
- Align directly with Strategy (WHY) & Operations (HOW)
- There is no ownership of Capabilities
- Provides a way of contextualizing value delivery from the Organization's perspective
- Provides a clearly defined boundary for the value domain

❖ Services

- Are consumed by one or more stakeholders (internal and/or external)
- Directly support Capabilities
- Are owned, measured, and managed by a "named" stakeholder
- Are Customer Focused
- Performance is measured by Customer Feedback
- Provide a clearly defined boundary for the problem domain *

❖ Processes

- One or more activities that are used to deliver a service
- An Activity has inputs & outputs and are initiated by a trigger (planned or unplanned event)
- An Activity is (typically) performed by one stakeholder (individual) with specific skills / knowledge
- A Flow is a series of Activities (and Events) that are performed in a defined sequence
- A Process is a Flow with a clear START & END points
- Processes are execution focused
- Performance is measured by Accuracy & Consistency

* key for applying AI & ML effectively

Business Model Enabled By Services

Optimizing Value Delivery with Services

This is where value is created and delivered. The capabilities embodied in these areas provide the foundation for the business architecture.

All other functional operations exist to guide and support these 4 capabilities. They provide services to enable these capabilities and support other functional areas.

Applying DNA to Service Management

Service Level Measurement

DRAFT Service Model						
Operations Management Services - Server Management						
Activity	Services	Level	ETC (Days)	Expectations	Quality (Defects)	Performance
Server & Storage Integration Plan	Identify Computing & Storage Needs Procure / Allocate Assets Establish Computing & Storage Consolidate existing hardware	1	20	Computing needs identified, implemented. Existing systems & data migrated to GS standard environments. Older equipment retired / repurposed.	1	75% (Jan 2013 - JGS 2013) 85% (Aug 2013 - Dec 2013) 95% (Jan 2014 - - -)
Server & Storage Integration Plan	Identify Computing & Storage Needs Procure / Allocate Assets Establish Computing & Storage Migrate/Consolidate existing hardware	2	30	Computing needs identified, implemented. Existing systems & data migrated to GS standard environments. Older equipment retired / repurposed.	3	75% (Jan 2013 - JGS 2013) 85% (Aug 2013 - Dec 2013) 95% (Jan 2014 - - -)
Server & Storage Integration Plan	Identify Computing & Storage Needs Draft Transition Plan Procure / Allocate Assets Establish Computing & Storage Execute Transition Plan	3	40	Computing needs identified, implemented. Existing systems & data migrated to GS standard environments. Older equipment retired / repurposed.	5	75% (Jan 2013 - JGS 2013) 85% (Aug 2013 - Dec 2013) 95% (Jan 2014 - - -)
