

Biz Model Outline

Overview

Stakeholder Engagement

End-2-End Patient Flow

Technology Platform

Holistic Healthcare Outcomes

Logo incorporates the DNA emblem (double helix), provides colors typically found in symbols for water. The solid line provides a sense of stability and control, while the name suggests a flow (for the patient & information)

Mission

Diagnose and treat patients with chronic and/or difficult to treat conditions with the goal of restoring them to a more optimum state of health & function.

Approach

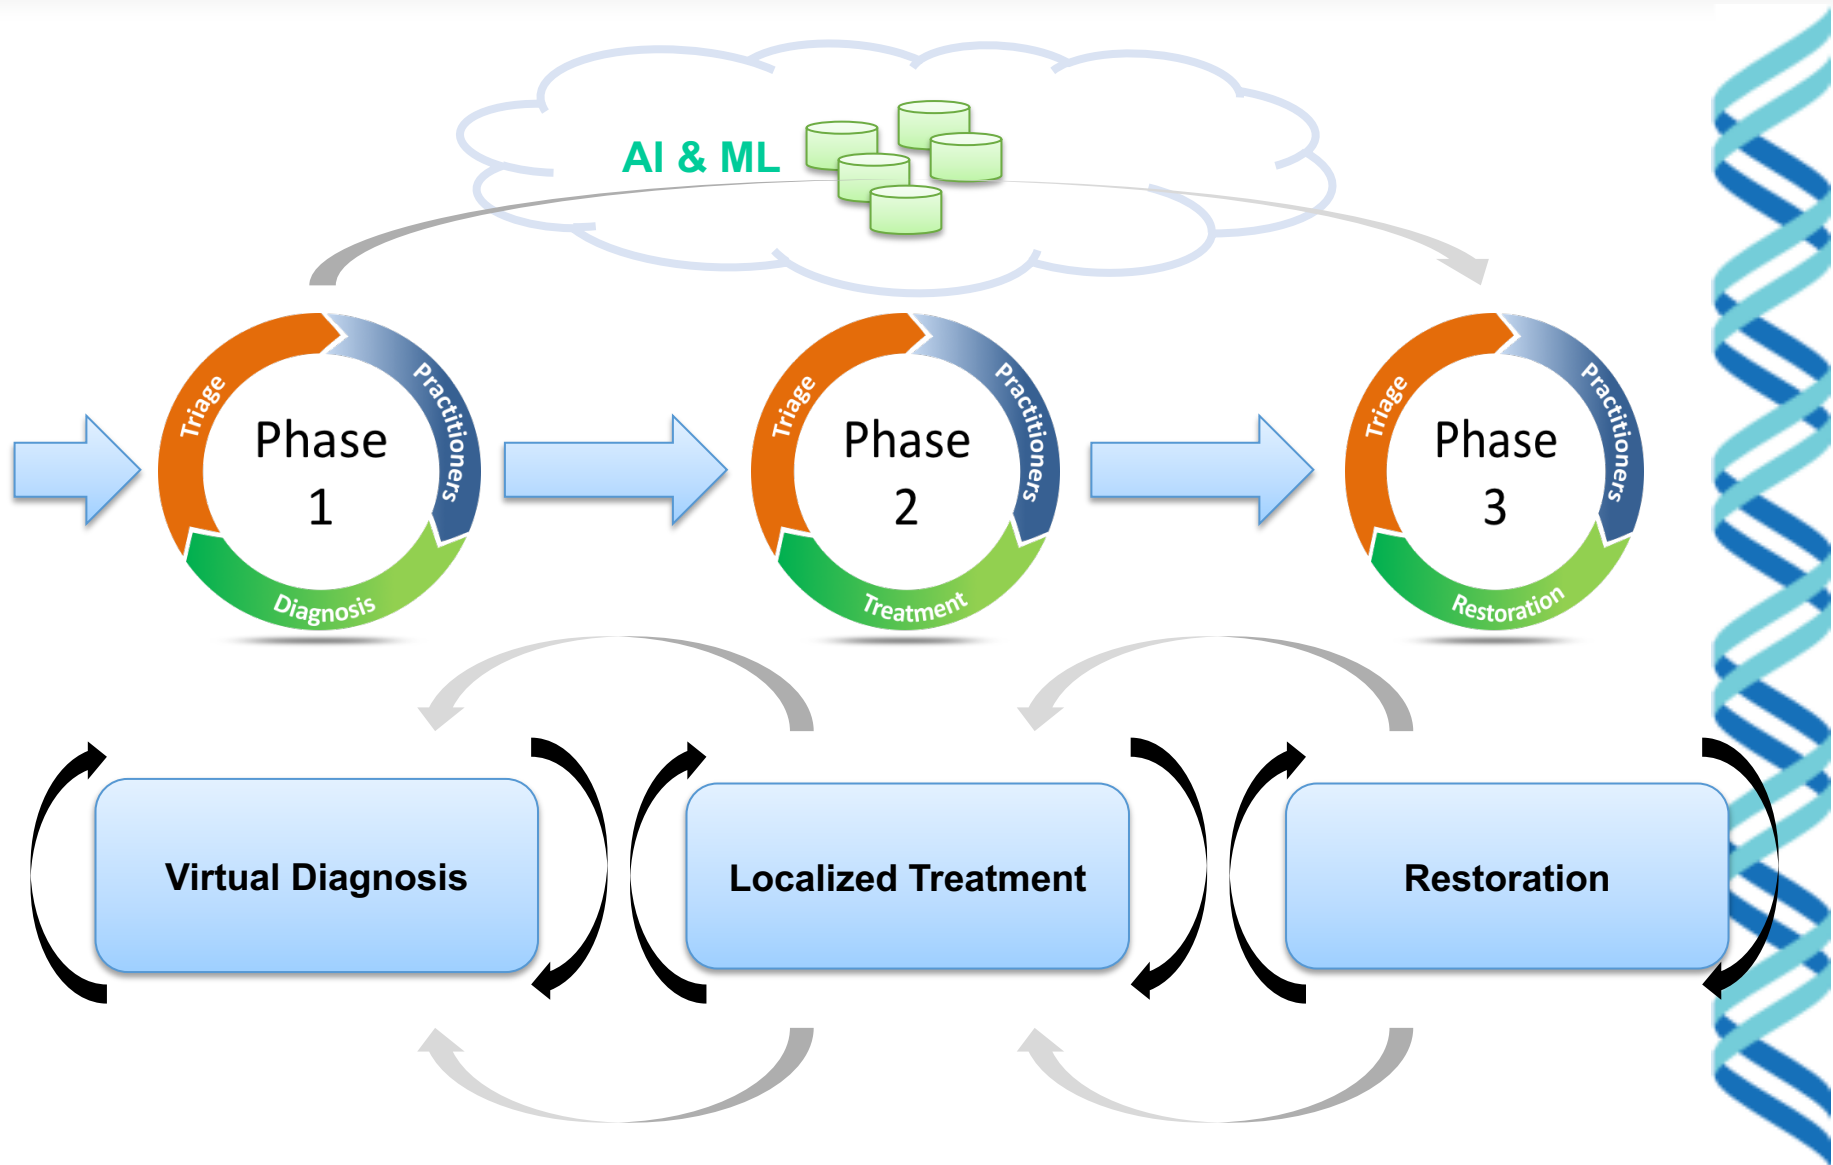

Put the patient in control. Bring the practitioners and knowledge together using a participatory model to improve diagnostic capability. Recommend treatment options for the patient, where they can be delivered locally to the patient. Advocate for the patient and monitor their behaviors to ensure they achieve optimal results.

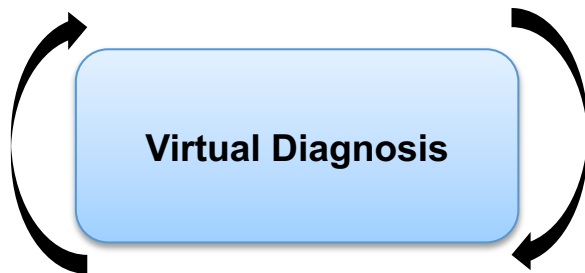

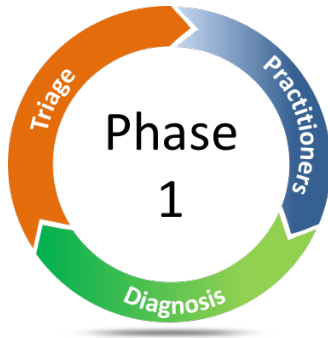

Goals

- Reduce overall costs for patient
- Improve understanding of causal factors
- Restore patient to more optimum condition

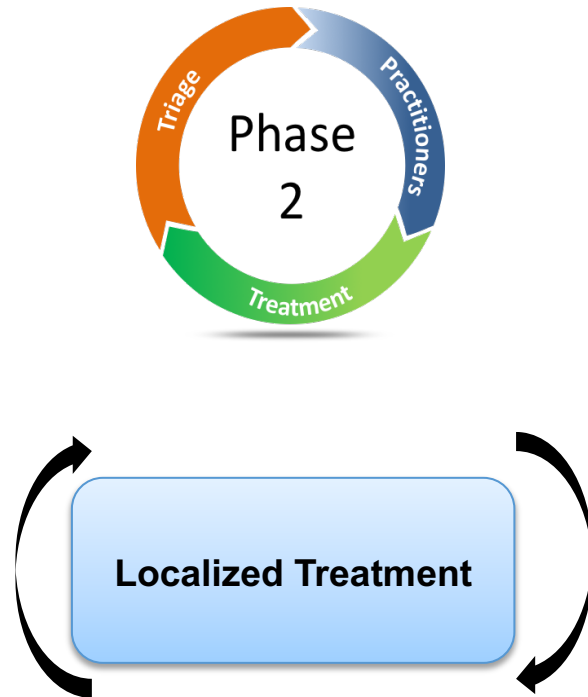

HEALTHCARE APPROACHES

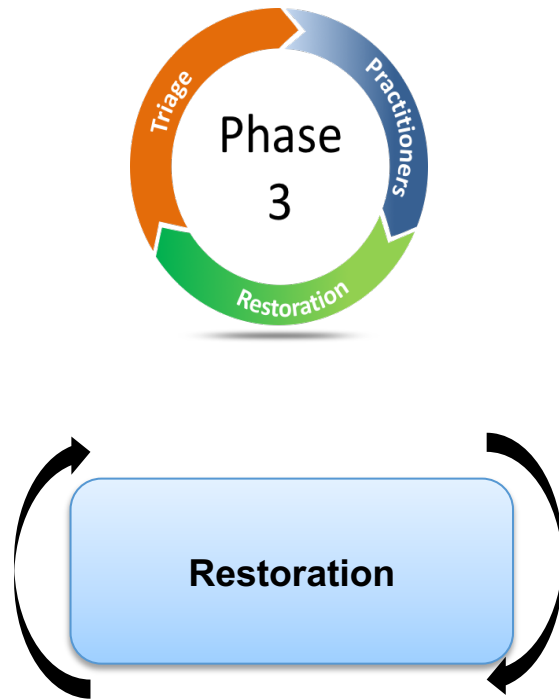

- Patient opens new case (online)
- Patient provides background
- Patient uploads medical records
- Triage Team reviews case file
- Case file presented to practitioners
- Practitioners provide diagnostic insights
- Triage Team reviews insights
- Triage team recommends treatment options

- Advocate consults with Patient
- Advocate reviews local practitioners
- Patient selects / Visits practitioner
- Local Practitioner provides treatment
- Advocate & Practitioner monitor results
- Advocate & Practitioner adjusts treatment

- Patient continues treatment
- Advocate monitors behaviors
- Advocate reinforces / supports patient
- Advocate & Practitioner monitor results
- Patient completes treatment

- ❑ The challenge of working with chronic and/or hard to diagnose conditions are that they are not well understood
- ❑ The heart of the model is to build participation into all 3 phases of care through a collaborative platform
- ❑ Iteration is included throughout the process model since the nature of diagnosis and treatment of patients with chronic conditions is not simple
- ❑ The front end of the patient interaction is designed to avoid any further payment for the patient since the patient has (most likely) incurred significant time and payment for treatment that has not worked

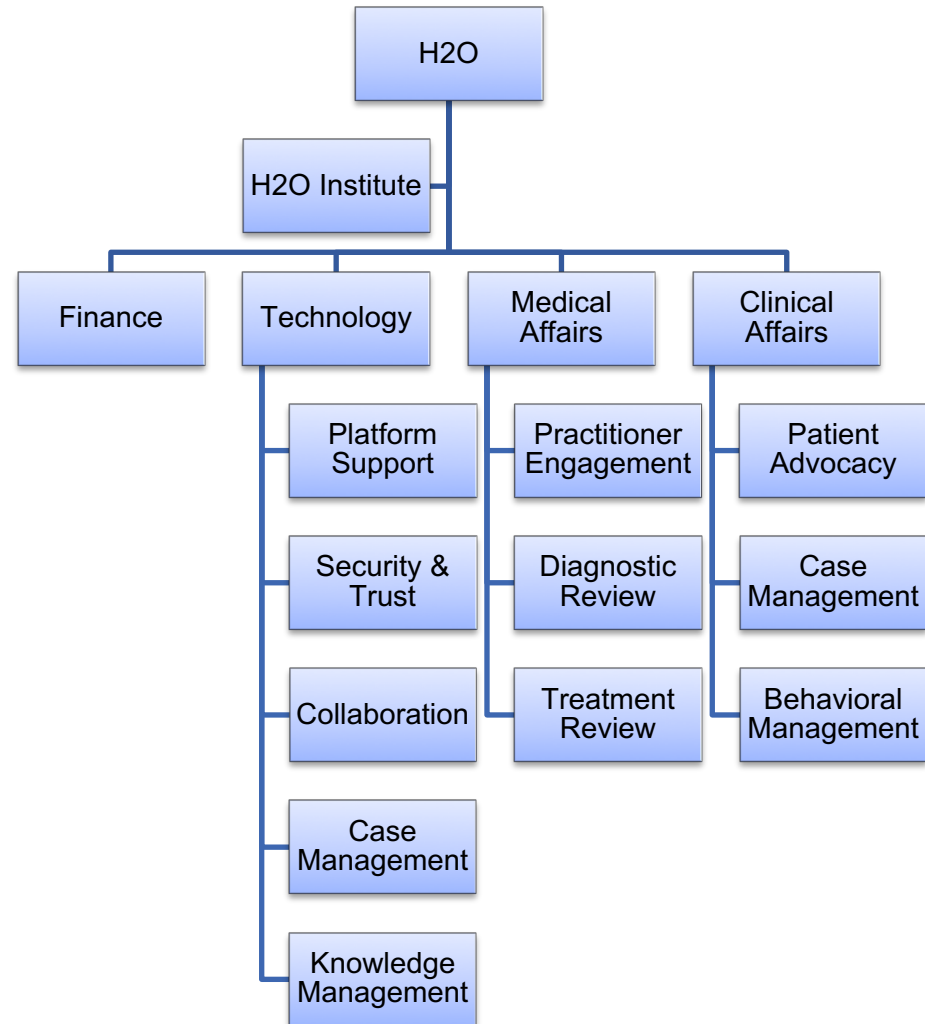

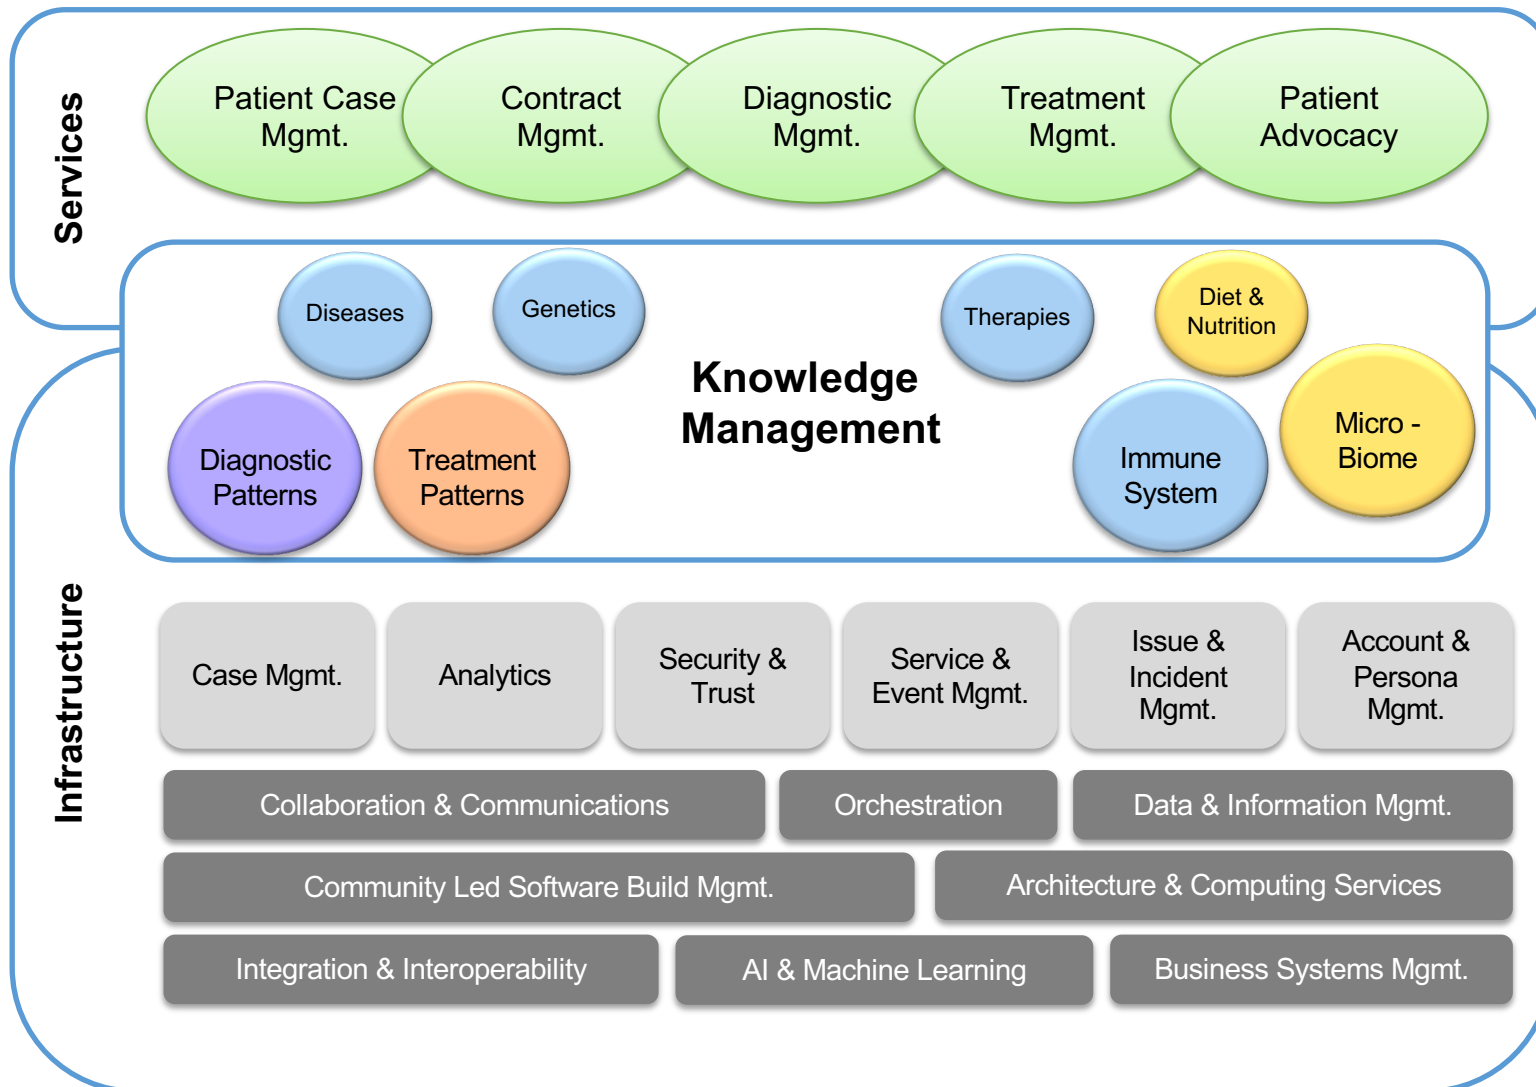

- ❑ As mentioned in prior slides, the key opportunity to transform the care for patients is to minimize any further impact on the patient upfront.
- ❑ The goal is to establish a shared case management model amongst practitioners using participation to improve diagnosis using “open” collaboration (patterned after the Wikipedia model).
- ❑ In order for the open source model to work, H2O will need to vet the participants (practitioners). Another component of the biz model is to establish a formal and separate organization (H2O Institute) to provide training, certification, measurement, and drive continuous improvement for participants & process

Organization Model

- ❑ This is only an initial draft and is expected to change as the biz model evolves.
- ❑ Just because there is an org structure, does not imply that these are all employees.
- ❑ The structure exists to ensure patients receive the right services towards the mission & goals.
- ❑ A key tenant is to foster collaboration horizontally and vertically across the virtual value chain.

Team Oriented Approach
