

EA Principles & Standards

Rethinking our approach in IT

- ❑ Many IT organizations endorse the common practice of placing standards on tools or equipment.
- ❑ The problem when they do that, is that it "binds" the decision making process as opposed to guiding the right decisions that align with EA principles.

Considerations for IT and the Enterprise

- ❑ The goal for EA principles are to guide and expedite decision making for IT in the use and deployment of technology.
- ❑ The goal for EA principles for solution architecture are to ensure the right problem has been identified and the best options are presented for review.

5 Core Themes for Principles

☐ Agility

- Ensures we can respond quickly to changes in business needs.

☐ Efficiency

- Ensures we can deploy technology with a low consumptions of resources – human and otherwise.

☐ Adaptability

- Ensures the technology can embrace change – timely, easily, and where possible w/o human intervention.

5 Core Themes for Principles (cont.)

❑ Extensibility

- Ensures the technology can scale (vertically to meet growth volume of data & users) (laterally to meet growth in complexity of functionality).

❑ Innovation

- Ensures we can bring new value to the business by identifying new technologies, leveraging existing technologies in creative new ways and pioneering technology where possible through collaboration and by encouraging ideation by everyone w/in & w/o IT).

Establishing EA Standards

- ❑ The goal for EA standards are to provide guidance to the 6 architecture domains, used to support the practice of enterprise architecture w/in and w/out an enterprise:
 - ❑ Solution Architecture is used within a single domain (w/in an enterprise to support the functional areas).
 - ❑ Enterprise Architecture is used across multiple domains (spanning one or more enterprises).

Standards for Business Architecture

- ☐ Adherence to business models, integration of strategy / planning and portfolio mgmt
- ☐ Adherence to domain models for aligning customer needs, for requirements engineering
- ☐ Adherence to KPI models (for measuring performance), testing methodologies and quality assurance/engineering
- ☐ Adherence to methodologies for capturing customer outcomes and warehousing them
- ☐ Adherence to consistent prioritization models to drive efficiency and effective investments
- ☐ Adherence to alignment of customer outcomes when driving innovation and change
- ☐ Adherence to a consistent semantic model to align customer outcomes
- ☐ Adherence to consistent value models to drive the right decisions and culture
- ☐ Adherence to consistent incentive models to drive the right behaviors

Standards for Information Architecture

- ☐ Adherence to data models
- ☐ Adherence to meta data models (rules, constraints, PSM abstractions, bindings, ontologies, taxonomies and relationships / mappings)
- ☐ Adherence to integration models (between systems, devices, components, between platforms, and between architecture layers)
- ☐ Adherence to analytics models and measures (used for aggregation, filtering, masking,
- ☐ Adherence to ETL frameworks (extraction, transformation and loading rules should be instantiated as meta data)

Standards for Application Architecture

- ☐ Adherence to design patterns (see list below)
- ☐ Adherence to OMG standards
- ☐ Adherence to PIM Layer (platform independence model)
- ☐ -----
- ☐ Adherence to presentation layer guidelines
- ☐ Adherence to human interface design standards
- ☐ Adherence to business logic layer guidelines
- ☐ Adherence to business process layer guidelines
- ☐ Adherence to workflow / service patterns
- ☐ Adherence to orchestration, provisioning and scheduling frameworks
- ☐ Adherence to open system standards

Standards for Technology Architecture

- ☐ Adherence to ubiquitous platforms
- ☐ Adherence to data storage abstraction
- ☐ Adherence to data warehousing standards
- ☐ Adherence to distributed and federated models (for data & computing resources)
- ☐ Adherence to distributed network and messaging frameworks
- ☐ Adherence to open systems standards

Standards for Operational Architecture

- ☐ Adherence to customer support models
- ☐ Adherence to performance management models (measuring, tracking, reporting, execution)
- ☐ Adherence to contingency management models (disaster recovery covering business operations & technology)
- ☐ Adherence to proactive change management models (versus reactive models)
- ☐ Adherence to resiliency models (moving towards self-healing capabilities)

Standards for Information Architecture

- ☐ Adherence to a single change management platform
- ☐ Adherence to a federated portfolio model (separate discussion)
- ☐ Adherence to post implementation monitoring (measure for success) and fail forward (learning)
- ☐ Adherence to asset management models and version management models
- ☐ Adherence to auditing, tracking, and logging models (services, repositories, and monitoring)
- ☐ Adherence to quality engineering best practices

Beyond Principles & Standards

- ❑ In addition to principles and standards, it might be useful to consider some of the following Design Patterns when defining structures for an organization.

Design Patterns

- ❑ HRM – Human Resource Management
- ❑ EPM – Enterprise Portfolio Management
- ❑ BRM – Business Rules Management
- ❑ PLM – Produce Lifecycle Management
- ❑ RLM – Requirements Lifecycle Management
- ❑ EAM – Enterprise Asset Management
- ❑ ODI – Outcome Driven Innovation (precursor to RLM)
- ❑ SCM – Supply Chain Management
- ❑ SRM – Supplier Relationship Management
- ❑ CRM – Customer Relationship Management
- ❑ EcM – Enterprise Content Management
- ❑ BpM – Business Process Management
- ❑ BPM – Business Productivity Management
- ❑ ECM – Enterprise Collaboration Management
- ❑ EKM – Enterprise Knowledge Management
- ❑ EIM – Enterprise Integration Management

Thank You

Measure what matters
Create and deliver the right value
Build and nurture a winning culture
Proactively manage change & complexity
