

Platform Assessment

The Problem

Many ERP systems are nearing end-of-life and new cloud technologies offer security, efficiency and services delivery advantages. Accelare's S2E process is a more efficient and effective way to determine technology selection and migration strategies.

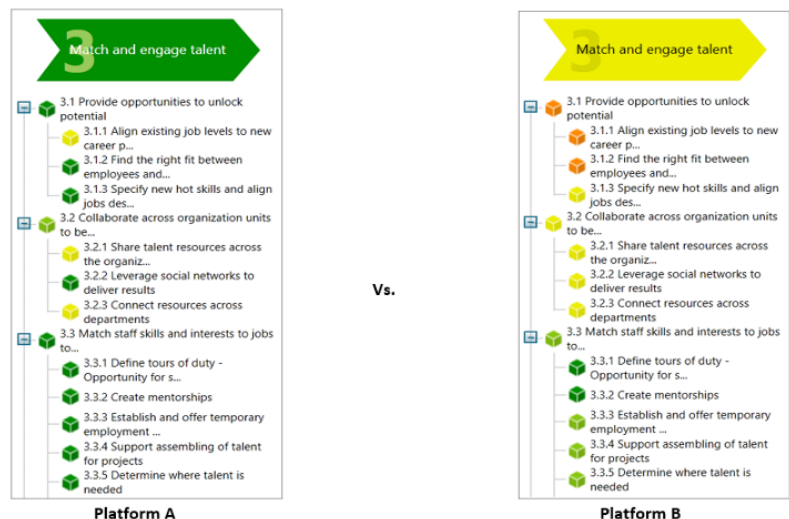

How We Helped

The work of transforming HR to win in the talent management space is not about technology. It is about capabilities which are containers of people, process and technology. For a public sector branch under pressure for better service delivery and tools to build a more productive workforce, we were asked to address the best path for moving toward a contemporary talent and performance management services organization.

What we found was that current HR services fail to meet a vast majority of desired capabilities and services. The organization architecture was functional, highly decentralized and overstaffed compared to industry benchmarks. Shared services were ignored. More importantly, HR was not viewed as strategic and capable of delivering needed services; leaving agencies on their own.

On the technology architecture side, the HRIS Platform was ineffective in meeting the manager, employee and candidate needs. The decision the team faced was to stay on the current course (the platform was nearing end of life and not current state technology) and add modules, upgrades and reconfigure or consider other platforms.

The team had completed a "heat map of the HR capabilities required for the future state. They then mapped the current platform and a unified cloud alternate to compare which capabilities and processes were delivered (shown in green) or supported (shown yellow) by the technology. Next, they did a detailed assessment of the business value of properly operating capabilities.

Outcomes

The team quickly learned that they can gain big efficiencies from new operating model and platforms. In fact, the total cost of ownership was basically a wash. In addition to the business value, IT benefits were significant:

- Lower support costs; minimize maintenance and support
- Single point of control
- Eliminate redundant data entry
- Improved data integrity – know where the source of truth lives and where to go – one location
- More effective and efficient update process
- Speed and simplify training; increased user adoption
- Better business insight and responsiveness to business change with current and accurate data

By restructuring the HR service delivery system and changing platforms, the organization will see substantial savings.
